

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use Tyzeka safely and effectively. See full prescribing information for Tyzeka.

Tyzeka (telbivudine) tablets

Initial U.S. Approval: 2006

WARNING: LACTIC ACIDOSIS, SEVERE HEPATOMEGALY WITH STEATOSIS & SEVERE ACUTE EXACERBATIONS of HEPATITIS B

See full prescribing information for complete boxed warning.

- Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues (5.1).
- Severe acute exacerbations of hepatitis B have been reported in patients who discontinued anti-hepatitis B therapy, including Tyzeka. Hepatic function should be monitored closely in patients who discontinue therapy. Resumption of anti-hepatitis B therapy may be warranted (5.2).

RECENT MAJOR CHANGES

- Warnings and Precautions, Peripheral Neuropathy (5.4) 1/2009

INDICATIONS AND USAGE

Tyzeka is an HBV nucleoside analogue reverse transcriptase inhibitor indicated for the treatment of chronic hepatitis B in adult patients with evidence of viral replication and either evidence of persistent elevations in serum aminotransferases (ALT or AST) or histologically active disease (1.1).

DOSAGE AND ADMINISTRATION

- Adults and Adolescents (≥ 16 years of age): 600 mg once daily, taken orally, with or without food (2.1).
- Renal Impairment: Dose adjustment required in patients with creatinine clearance < 50 mL/min (2.2); as follows:

Creatinine Clearance (mL/min)	Telbivudine Dose Tablet (600 mg)
≥ 50	1 tab every 24 hrs
30 – 49	1 tab every 48 hrs
< 30 (not requiring dialysis)	1 tab every 72 hrs
End stage renal disease (ESRD) ¹	1 tab every 96 hrs

¹ When administered on hemodialysis days, administer Tyzeka after hemodialysis (2.2)

DOSAGE FORMS AND STRENGTHS

- Tablet: 600-mg tablets supplied in 30-count bottles (3.1).

CONTRAINDICATIONS

None (4).

WARNINGS AND PRECAUTIONS

- Lactic acidosis and severe hepatomegaly with steatosis: If suspected, treatment should be suspended (5.1).
- Severe acute exacerbations of hepatitis B after discontinuation: Monitor hepatic function closely for at least several months (5.2, 6.1).
- Myopathy: TYZEKA should be interrupted if myopathy suspected; and discontinued if confirmed. It is unknown whether risk of myopathy is increased with concomitant use of other medications associated with myopathy (5.3).
- Peripheral Neuropathy: TYZEKA should be interrupted if peripheral neuropathy is suspected; and discontinued if confirmed. Risk increased when used in combination with pegylated interferon alfa-2a. Avoid concomitant use of pegylated interferon alfa-2a or other interferons (5.4, 7).

ADVERSE REACTIONS

In clinical trials, the most common adverse reactions ($\geq 3\%$), of any severity, were: fatigue, increased creatine kinase (CK), headache, cough, diarrhea, abdominal pain, nausea, pharyngolaryngeal pain, arthralgia, pyrexia, rash, back pain, dizziness, myalgia, ALT increased, dyspepsia, insomnia, and abdominal distension (6.1). The most common adverse events resulting in Tyzeka discontinuation included increased CK, nausea, diarrhea, fatigue, myalgia, and myopathy (6.1).

To report SUSPECTED ADVERSE REACTIONS, contact Novartis Pharmaceuticals Corporation at 1-888-669-6682 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch

DRUG INTERACTIONS

- Co-administration of Tyzeka with drugs that affect renal function may alter plasma concentrations of telbivudine and/or coadministered drug (7).
- Co-administration of Tyzeka with pegylated interferon alfa-2a or other interferons may increase the risk and severity of peripheral neuropathy (7).

FULL PRESCRIBING INFORMATION

WARNING: LACTIC ACIDOSIS/SEVERE HEPATOMEGALY WITH STEATOSIS & SEVERE ACUTE EXACERBATIONS OF HEPATITIS B

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination with antiretrovirals[see *Warnings and Precautions (5.1)*].

Severe acute exacerbations of hepatitis B have been reported in patients who have discontinued anti-hepatitis B therapy, including Tyzeka. Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several months in patients who discontinue anti-hepatitis B therapy. If appropriate, resumption of anti-hepatitis B therapy may be warranted [see *Warnings and Precautions (5.2)*].

1 INDICATIONS AND USAGE

1.1 Chronic Hepatitis B

Tyzeka is indicated for the treatment of chronic hepatitis B in adult patients with evidence of viral replication and either evidence of persistent elevations in serum aminotransferases (ALT or AST) or histologically active disease.

The following points should be considered when initiating therapy with Tyzeka:

- This indication is based on virologic, serologic, biochemical and histologic responses in nucleoside-treatment-naïve adult patients with HBeAg-positive and HBeAg-negative chronic hepatitis B with compensated liver disease [see *Clinical Studies (14)*].
- Telbivudine has not been evaluated in patients co-infected with HIV, HCV or HDV.
- Telbivudine has not been evaluated in liver transplant recipients or in patients with decompensated liver disease.
- Telbivudine has not been studied in well-controlled trials for the treatment of patients with established nucleoside analog reverse transcriptase inhibitor-resistant hepatitis B virus infection, but is expected to be cross-resistant to lamivudine [see *Microbiology (12.4)*].

2 DOSAGE AND ADMINISTRATION

2.1 Adults and Adolescents (≥16 years of age)

The recommended dose of telbivudine for the treatment of chronic hepatitis B is 600 mg once daily, taken orally, with or without food.

2.2 Renal Impairment

Telbivudine may be used for the treatment of chronic hepatitis B in patients with impaired renal function. No adjustment to the recommended dose of telbivudine is necessary in patients whose creatinine clearance is ≥50 mL/min. Adjustment of dose regimen is required in patients with creatinine clearance <50 mL/min including those with ESRD on hemodialysis (Table 1).

Table 1 Dose Regimen Adjustment of Tyzeka in Patients with Renal Impairment

Creatinine Clearance (mL/min)	Telbivudine Dose (1 tablet = 600 mg)
≥ 50	1 tablet every 24 hrs
30–49	1 tablet every 48 hrs
<30 (not requiring dialysis)	1 tablet every 72 hrs

ESRD

1 tablet every 96 hrs^a

^a When administered on hemodialysis days, Tyzeka should be administered after hemodialysis.

2.3 Hepatic Impairment

No adjustment to the recommended dose of telbivudine is necessary in patients with hepatic impairment.

2.4 Duration of Therapy

The optimal duration of therapy with Tyzeka for patients with chronic hepatitis B is unknown.

3 DOSAGE FORMS AND STRENGTHS

3.1 Tablets

Tyzeka (telbivudine) 600-mg tablets are white to slightly yellowish film-coated, ovaloid-shaped tablets, imprinted with “LDT” on one side.

Bottle of 30 tablets (NDC 0078-0538-15) with child-resistant closure.

4 CONTRAINDICATIONS

None

5 WARNINGS AND PRECAUTIONS

5.1 Lactic Acidosis

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination with antiretrovirals. Female gender, obesity and prolonged nucleoside exposure may be risk factors. Particular caution should be exercised when administering HBV nucleoside analogue reverse transcriptase inhibitors to patients with known risk factors for liver disease; however, cases have also been reported in patients with no known risk factors. Treatment with Tyzeka should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations).

5.2 Exacerbations of Hepatitis B after Discontinuation of Treatment

Severe acute exacerbations of hepatitis B have been reported in patients who have discontinued anti-hepatitis B therapy, including Tyzeka. Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several months in patients who discontinue anti-hepatitis B therapy. If appropriate, resumption of anti-hepatitis B therapy may be warranted [*see Adverse Reactions (6.1)*].

5.3 Myopathy

Cases of myopathy/myositis have been reported with telbivudine use several weeks to months after starting therapy. Myopathy has also been reported with some other drugs in this class. Isolated cases of rhabdomyolysis have been reported during postmarketing use of Tyzeka [*see Adverse Reactions (6.2)*].

Uncomplicated myalgia has been reported in telbivudine-treated patients [*see Adverse Reactions (6.1)*]. Myopathy, defined as persistent unexplained muscle aches and/or muscle weakness in conjunction with increases in creatine kinase (CK) values, should be considered in any patient with diffuse myalgias, muscle tenderness or muscle weakness. Among patients with telbivudine-associated myopathy, no pattern with regard to the degree or timing of CK elevations has been observed. In addition, the predisposing factors for the development of myopathy among telbivudine recipients are unknown. Patients should be advised to report promptly unexplained muscle aches, pain, tenderness or weakness. Telbivudine therapy should be interrupted if myopathy is suspected, and discontinued if myopathy is confirmed. It is unknown whether the risk of myopathy during treatment with drugs in this class is increased with concurrent administration of other drugs associated

with myopathy, including but not limited to: corticosteroids, chloroquine, hydroxychloroquine, certain HMGCoA reductase inhibitors, fibric acid derivatives, penicillamine, zidovudine, cyclosporine, erythromycin, niacin, and certain azole antifungals. Physicians initiating concomitant treatment with any drug associated with myopathy should monitor patients closely for any signs or symptoms of unexplained muscle pain, tenderness, or weakness.

5.4 Peripheral Neuropathy

Peripheral neuropathy has been reported with telbivudine alone or in combination with pegylated interferon alfa-2a and other interferons. In one clinical trial, an increased risk and severity of peripheral neuropathy was observed with the combination use of telbivudine and pegylated interferon alfa-2a compared to telbivudine alone [see *Drug Interactions* (7)]. The safety and efficacy of telbivudine in combination with pegylated interferons or other interferons for the treatment of chronic hepatitis B has not been demonstrated. Patients should be advised to report any numbness, tingling, and/or burning sensations in the arms and/or legs, with or without gait disturbance. Telbivudine therapy should be interrupted if peripheral neuropathy is suspected, and discontinued if peripheral neuropathy is confirmed [see *Adverse Reactions* (6.1)].

6 ADVERSE REACTIONS

The following adverse reactions are discussed in other sections of the labeling:

- Lactic acidosis and severe hepatomegaly with steatosis [See *Boxed Warning, Warnings and Precautions* (5.1)]
- Severe acute exacerbations of hepatitis after discontinuation of treatment [See *Boxed Warning, Warnings and Precautions* (5.2)]
- Myopathy [See *Warnings and Precautions* (5.3)]
- Peripheral Neuropathy [See *Warnings and Precautions* (5.4)]

6.1 Clinical Trial Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be compared directly to the rates in the clinical trials of another drug and may not reflect the rates observed in practice.

Assessment of adverse reactions is primarily based on two studies (007 GLOBE and NV-02B-015) in which 1,699 subjects with chronic hepatitis B received double-blind treatment with telbivudine 600 mg/day (n=847 subjects) or lamivudine (n=852 subjects) for 104 weeks. The median duration of therapy was 104 weeks for both treatment groups.

In the 104 week clinical studies, most adverse experiences reported with telbivudine were classified as mild or moderate in severity and were not attributed to telbivudine. Selected adverse events of any severity which were reported in $\geq 3\%$ of telbivudine and lamivudine recipients are shown in Table 2. With the exception of increased creatine kinase (CK), which was reported more frequently among telbivudine recipients, the adverse event profile was similar for the two drugs.

Table 2. Selected Common Adverse Events^a in Pooled Studies 007 GLOBE and NV-02B-015

Adverse Event (Preferred Term)	Telbivudine N=847 n (%) ^b	Lamivudine N=852 n (%) ^b
Fatigue	106 (13)	95 (11)
CK increased	90 (11)	52 (6)

Headache	83 (10)	95 (11)
Cough	52 (6)	45 (5)
Diarrhea	50 (6)	46 (5)
Abdominal pain, upper	49 (6)	52 (6)
Nausea	45 (5)	40 (5)
Pharyngolaryngeal pain	38 (5)	31 (4)
Arthralgia	37 (4)	38 (5)
Pyrexia	34 (4)	27 (3)
Rash	33 (4)	21 (3)
Back pain	33 (4)	32 (4)
Dizziness	32 (4)	43 (5)
Abdominal pain	29 (3)	31 (4)
Myalgia	27 (3)	17 (2)
ALT increased	27 (3)	31 (4)
Dyspepsia	24 (3)	39 (5)
Insomnia	24 (3)	22 (3)
Abdominal distension	22 (3)	19 (2)
Pruritus	18 (2)	23 (3)
Hepatitis B exacerbation	17 (2)	36 (4)

^a Adverse events reported in $\geq 3\%$ subjects in either treatment group

^b n (%) = the number and proportion of subjects in whom adverse event was reported

Moderate to severe (Grade 2-4) adverse events were reported in 239/847 (28%) of telbivudine recipients and 229/852 (27%) of lamivudine recipients. The profile of adverse events of moderate to severe intensity was similar in both treatment groups and no individual adverse event was reported in $> 2\%$ of subjects in either treatment group.

Discontinuations due to adverse events were reported in 4% of telbivudine recipients and 4% of lamivudine recipients. The most common adverse events resulting in telbivudine discontinuation included increased CK, nausea, diarrhea, fatigue, myalgia, and myopathy.

Peripheral neuropathy was reported as an adverse event in $< 1\%$ (2/847) of subjects receiving telbivudine monotherapy [*see Warnings and Precautions (5.4)*]. Of telbivudine-treated subjects $< 1\%$ (5/847) were diagnosed with myopathy/myositis (presenting with muscular weakness) [*see Warnings and Precautions (5.3)*].

Laboratory Abnormalities

Frequencies of selected treatment-emergent laboratory abnormalities in the 007 GLOBE and NV-02B-015 studies are listed in Table 3.

Table 3 Selected Treatment-Emergent Grade 3-4 Laboratory Abnormalities^a in Patients with Chronic

Hepatitis B in the 104-Week Pooled 007 GLOBE and NV-02B-015 Studies

Test	Telbivudine 600 mg (n=847)	Lamivudine 100 mg (n=852)
Creatine Kinase (CK) >7.0 x ULN	13%	4%
ALT >10.0 x ULN and 2.0 x baseline ^b	5%	8%
ALT > 3 x baseline	7%	13%
AST (SGOT) >3.0 x baseline	6%	10%
Lipase >2.5 x ULN	2%	4%
Amylase >3.0 x ULN	<1%	<1%
Total Bilirubin >5.0 x ULN	<1%	<1%
Neutropenia (ANC ≤749/mm ³)	2%	2%
Thrombocytopenia (Platelets ≤49,999/mm ³)	<1%	<1%

^a On-treatment value worsened from baseline to Grade 3 or Grade 4 during therapy

^b American Association for the Study of Liver Diseases (AASLD) definition of acute hepatitis flare

Creatine Kinase (CK) Elevations

Creatine kinase (CK) elevations were more frequent among subjects on telbivudine treatment. By 104 weeks of treatment, Grade 1-4 CK elevations occurred in 79% of telbivudine-treated subjects and 47% of lamivudine-treated subjects. Grade 3 or 4 CK elevations occurred in 13% of telbivudine-treated subjects and 4% of lamivudine-treated subjects. Most CK elevations were asymptomatic, but the mean recovery time was longer for subjects on telbivudine than subjects on lamivudine.

Among telbivudine-treated subjects with Grade 1-4 CK elevations, 10% developed a musculoskeletal adverse event compared to 5% of lamivudine-treated subjects. A total of 2% (13/847) telbivudine-treated subjects interrupted or discontinued study drug due to CK elevation or musculoskeletal adverse events¹.

ALT Flares during Treatment

The incidence of ALT flares, defined as ALT > 10 x ULN and > 2 x baseline, was similar in the two treatment arms (3%) in the first six months. After week 24, ALT flares were reported less frequently in the telbivudine arm (2%) compared to the lamivudine arm (5%). Periodic monitoring of hepatic function is recommended during chronic hepatitis B treatment.

Exacerbations of Hepatitis after Discontinuation of Treatment

In the subset of subjects who discontinued treatment prematurely for reasons other than efficacy, or who elected not to continue telbivudine in another clinical trial, 9/154 (6%) telbivudine-treated and 10/180 (6%) lamivudine-treated subjects experienced an exacerbation of hepatitis (ALT elevation > 2 x baseline and > 10 x ULN) in the 4-month post-treatment period.

6.2 Postmarketing Experience

The following adverse reactions have been reported during postmarketing use of TYZEKA. Because these reactions were reported voluntarily from a population of unknown size, it is not possible to reliably estimate their frequency or establish a causal relationship to TYZEKA exposure.

Musculoskeletal and Connective Tissue Disorders

Rhabdomyolysis

Nervous System Disorders

¹ Includes the Preferred Terms: back pain, chest wall pain, non-cardiac chest pain, chest discomfort, flank pain, muscle cramp, muscular weakness, musculoskeletal pain, musculoskeletal chest pain, musculoskeletal discomfort, musculoskeletal stiffness, myalgia, myofascial pain syndrome, myopathy, myositis, neck pain, and pain in extremity.

Paraesthesia, hypoaesthesia

Metabolism and Nutrition Disorders

Lactic acidosis

7 DRUG INTERACTIONS

Telbivudine is excreted mainly by passive diffusion so the potential for interactions between telbivudine and other drugs eliminated by renal excretion is low. However, because telbivudine is eliminated primarily by renal excretion, coadministration of telbivudine with drugs that alter renal function may alter plasma concentrations of telbivudine [*see Clinical Pharmacology (12.3)*].

A clinical trial investigating the combination of telbivudine, 600 mg daily, with pegylated interferon alfa-2a, 180 micrograms once weekly by subcutaneous administration, indicates that this combination may be associated with an increased risk of peripheral neuropathy occurrence and severity, in comparison to telbivudine alone [*see Warnings and Precautions (5.4)*].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Category B: Telbivudine is not teratogenic and has shown no adverse effects in developing embryos and fetuses in preclinical studies. Studies in pregnant rats and rabbits showed that telbivudine crosses the placenta. Developmental toxicity studies revealed no evidence of harm to the fetus in rats and rabbits at doses up to 1000 mg/kg/day, providing exposure levels 6- and 37-times higher, respectively, than those observed with the 600 mg/day dose in humans.

There are no adequate and well-controlled studies of telbivudine in pregnant women. Because animal reproductive toxicity studies are not always predictive of human response, telbivudine should be used during pregnancy only if potential benefits outweigh the risks.

Pregnancy Registry: To monitor fetal outcomes of pregnant women exposed to telbivudine, healthcare providers are encouraged to register such patients in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.

8.2 Labor and Delivery

There are no studies in pregnant women and no data on the effect of telbivudine on transmission of HBV from mother to infant. Therefore, appropriate interventions should be used to prevent neonatal acquisition of HBV infection.

8.3 Nursing Mothers

Telbivudine is excreted in the milk of rats. It is not known whether telbivudine is excreted in human milk. Mothers should be instructed not to breast-feed if they are receiving Tyzeka.

8.4 Pediatric Use

Safety and effectiveness of telbivudine in pediatric patients have not been established.

8.5 Geriatric Use

Clinical studies of telbivudine did not include sufficient numbers of subjects ≥ 65 years of age to determine whether they respond differently from younger subjects. In general, caution should be exercised when prescribing Tyzeka to elderly patients, considering the greater frequency of decreased renal function due to concomitant disease or other drug therapy. Renal function should be monitored in elderly patients, and dosage adjustments should be made accordingly [*see Clinical Pharmacology (12.3) and Dosage and Administration (2.2)*].

8.6 Renal Impairment

Telbivudine is eliminated primarily by renal excretion, therefore dose regimen adjustment is recommended in patients with creatinine clearance <50 mL/min, including patients with ESRD requiring hemodialysis [see *Dosage and Administration (2.2) and Clinical Pharmacology (12.3)*].

8.7 Liver Transplant Recipients

The safety and efficacy of telbivudine in liver transplant recipients has not been evaluated. The steady-state pharmacokinetics of telbivudine was not altered following multiple dose administration in combination with cyclosporine. If telbivudine treatment is determined to be necessary for a liver transplant recipient who has received or is receiving an immunosuppressant that may affect renal function, such as cyclosporine or tacrolimus, renal function should be monitored both before and during treatment with Tyzeka [see *Clinical Pharmacology (12.3) and Dosage and Administration (2.2)*].

8.8 Co-Infected Patients

Telbivudine has not been investigated in co-infected hepatitis B patients (e.g., patients co-infected with HIV, HCV or HDV).

9 DRUG ABUSE AND DEPENDENCE

Telbivudine is not a controlled substance and no potential for dependence has been observed.

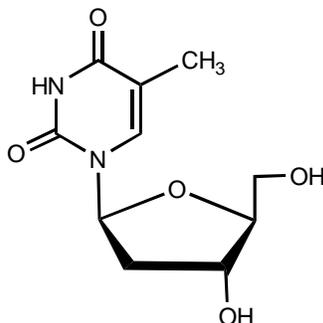

10 OVERDOSAGE

There is no information on intentional overdose of telbivudine, but one subject experienced an unintentional and asymptomatic overdose. Healthy subjects who received telbivudine doses up to 1800 mg/day for 4 days had no increase in or unexpected adverse events. A maximum tolerated dose for telbivudine has not been determined. In the event of an overdose, telbivudine should be discontinued, the patient must be monitored for evidence of toxicity, and appropriate general supportive treatment applied as necessary.

In case of overdosage, hemodialysis may be considered. Within 2 hours, following a single 200-mg dose of telbivudine, a 4-hour hemodialysis session removed approximately 23% of the telbivudine dose.

11 DESCRIPTION

Tyzeka is the trade name for telbivudine, a synthetic thymidine nucleoside analogue with activity against hepatitis B virus (HBV). The chemical name for telbivudine is 1-((2S,4R,5S)-4-hydroxy-5-hydroxymethyltetrahydrofuran-2-yl)-5-methyl-1H-pyrimidine-2,4-dione, or 1-(2-deoxy-β-L-ribofuranosyl)-5-methyluracil. Telbivudine is the unmodified β-L enantiomer of the naturally occurring nucleoside, thymidine. Its molecular formula is C₁₀H₁₄N₂O₅, which corresponds to a molecular weight of 242.23. Telbivudine has the following structural formula:

Telbivudine is a white to slightly yellowish powder. Telbivudine is sparingly soluble in water (>20 mg/mL), and very slightly soluble in absolute ethanol (0.7 mg/mL) and n-octanol (0.1 mg/mL).

Tyzeka film-coated tablets are available for oral administration in 600 mg strength. Tyzeka 600 mg film-coated tablets contain the following inactive ingredients: colloidal silicon dioxide, magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate. The tablet coating contains titanium dioxide, polyethylene glycol, talc and hypromellose.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Telbivudine is an antiviral drug [*see Microbiology (12.4)*].

12.2 Pharmacodynamics

In a randomized, partially single-blinded, placebo and active-controlled, four-period crossover study, 53 healthy subjects were administered Tyzeka 600mg, a suprathreshold Tyzeka 1800 mg dose, placebo, and moxifloxacin 400 mg. After 7 days of dosing, telbivudine did not prolong the QT interval. The maximum placebo-adjusted mean (upper 1-side 95% CI) change from baseline in QTcF on day 7 were 3.4 msec (5.9 msec) for the 600 mg and 4.4 msec (6.9 msec) for the 1800 mg dosing regimens.

12.3 Pharmacokinetics in Adults

The single- and multiple-dose pharmacokinetics of telbivudine were evaluated in healthy subjects and in patients with chronic hepatitis B. Telbivudine pharmacokinetics are similar between both populations.

Absorption and Bioavailability

Following oral administration of telbivudine 600 mg once-daily in healthy subjects (n=12), steady state peak plasma concentration (C_{max}) was 3.69 ± 1.25 $\mu\text{g/mL}$ (mean \pm SD) which occurred between 1 and 4 hours (median 2 hours), AUC was 26.1 ± 7.2 $\mu\text{g h/mL}$ (mean \pm SD), and trough plasma concentrations (C_{trough}) were approximately 0.2-0.3 $\mu\text{g/mL}$. Steady state was achieved after approximately 5 to 7 days of once-daily administration with \sim 1.5-fold accumulation, suggesting an effective half-life of \sim 15 hours.

Effects of Food on Oral Absorption

Telbivudine absorption and exposure were unaffected when a single 600-mg dose was administered with a high-fat (\sim 55 g), high-calorie (\sim 950 kcal) meal. Tyzeka (telbivudine) may be taken with or without food.

Distribution

In-vitro binding of telbivudine to human plasma proteins is low (3.3%). After oral dosing, the estimated apparent volume of distribution is in excess of total body water, suggesting that telbivudine is widely distributed into tissues. Telbivudine was equally partitioned between plasma and blood cells.

Metabolism and Elimination

No metabolites of telbivudine were detected following administration of [^{14}C]-telbivudine in humans. Telbivudine is not a substrate, or inhibitor of the cytochrome P450 (CYP450) enzyme system.

After reaching the peak concentration, plasma concentrations of telbivudine declined in a biexponential manner with a terminal elimination half-life ($T_{1/2}$) of 40-49 hours. Telbivudine is eliminated primarily by urinary excretion of unchanged drug. The renal clearance of telbivudine approaches normal glomerular filtration rate suggesting that passive diffusion is the main mechanism of excretion. Approximately 42% of the dose is recovered in the urine over 7 days following a single 600 mg oral dose of telbivudine. Because renal excretion is the predominant route of elimination, patients with moderate to severe renal dysfunction and those undergoing hemodialysis require a dose regimen adjustment [*see Dosage and Administration (2.2)*].

Special Populations

Gender: There are no significant gender-related differences in telbivudine pharmacokinetics.

Race: There are no significant race-related differences in telbivudine pharmacokinetics.

Pediatrics and Geriatrics: Pharmacokinetic studies have not been conducted in children or elderly subjects.

Renal Impairment: Single-dose pharmacokinetics of telbivudine have been evaluated in subjects (without chronic hepatitis B) with various degrees of renal impairment (as assessed by creatinine clearance). Based on the results shown in Table 4, adjustment of the dose regimen for Tyzeka is recommended in patients with creatinine clearance of <50 mL/min [see *Dosage and Administration (2.2)*].

Table 4 Pharmacokinetic Parameters (mean \pm SD) of Telbivudine in Subjects with Various Degrees of Renal Function

	Renal Function (Creatinine Clearance in mL/min)				
	Normal (>80) (n=8) 600 mg	Mild (50-80) (n=8) 600 mg	Moderate (30-49) (n=8) 400 mg	Severe (<30) (n=6) 200 mg	ESRD/ Hemodialysis (n=6) 200 mg
C_{max} ($\mu\text{g/mL}$)	3.4 \pm 0.9	3.2 \pm 0.9	2.8 \pm 1.3	1.6 \pm 0.8	2.1 \pm 0.9
AUC _{0-INF} ($\mu\text{g}\cdot\text{hr/mL}$)	28.5 \pm 9.6	32.5 \pm 10.1	36.0 \pm 13.2	32.5 \pm 13.2	67.4 \pm 36.9
CL _{RENAL} (L/h)	7.6 \pm 2.9	5.0 \pm 1.2	2.6 \pm 1.2	0.7 \pm 0.4	

Renally Impaired Subjects on Hemodialysis: Hemodialysis (up to 4 hours) reduces systemic telbivudine exposure by approximately 23%. Following dose regimen adjustment for creatinine clearance [see *Dosage and Administration (2.2)*], no additional dose modification is necessary during routine hemodialysis. When administered on hemodialysis days, Tyzeka should be administered after hemodialysis.

Hepatic Impairment: The pharmacokinetics of telbivudine following a single 600-mg dose have been studied in subjects (without chronic hepatitis B) with various degrees of hepatic impairment. There were no changes in telbivudine pharmacokinetics in hepatically impaired subjects compared to unimpaired subjects. Results of these studies indicate that no dosage adjustment is necessary for patients with hepatic impairment.

Drug Interactions

Drug-drug interaction studies show that lamivudine, adefovir dipivoxil, cyclosporine, pegylated interferon-alfa 2a and tenofovir disoproxil fumarate do not alter telbivudine pharmacokinetics. In addition, telbivudine does not alter the pharmacokinetics of lamivudine, adefovir dipivoxil, cyclosporine, or tenofovir disoproxil fumarate. No definitive conclusion could be drawn regarding the effects of telbivudine on the pharmacokinetics of pegylated interferon alfa-2a due to the high inter-individual variability of pegylated interferon alfa-2a concentrations. At concentrations up to 12 times that in humans, telbivudine did not inhibit *in-vitro* metabolism mediated by any of the following human hepatic microsomal cytochrome P450 (CYP) isoenzymes known to be involved in human medicinal product metabolism: 1A2, 2C9, 2C19, 2D26, 2E1, and 3A4. Based on the above results and the known elimination pathway of telbivudine, the potential for CYP450-mediated interactions involving telbivudine with other medicinal products is low.

12.4 Microbiology

Mechanism of Action

Telbivudine is a synthetic thymidine nucleoside analogue with activity against HBV DNA polymerase. It is phosphorylated by cellular kinases to the active triphosphate form, which has an intracellular half-life of 14 hours. Telbivudine 5'-triphosphate inhibits HBV DNA polymerase (reverse transcriptase) by competing with the natural substrate, thymidine 5'-triphosphate. Incorporation of telbivudine 5'-triphosphate into viral DNA causes DNA chain termination. Telbivudine is an inhibitor of both HBV first strand (EC₅₀ value = 1.3 \pm 1.6 μM) and second strand synthesis (EC₅₀ value = 0.2 \pm 0.2 μM). Telbivudine 5'-triphosphate at concentrations

up to 100 μM did not inhibit human cellular DNA polymerases α , β , or γ . No appreciable mitochondrial toxicity was observed in HepG2 cells treated with telbivudine at concentrations up to 10 μM .

Antiviral Activity in Cell Culture

The antiviral activity of telbivudine was assessed in the HBV-expressing human hepatoma cell line 2.2.15, as well as in primary duck hepatocytes infected with duck hepatitis B virus. The concentration of telbivudine that effectively inhibited 50% of viral DNA synthesis (EC_{50}) in both systems was approximately 0.2 μM . The anti-HBV activity of telbivudine was additive with adefovir in cell culture, and was not antagonized by the HIV NRTIs didanosine and stavudine. Telbivudine is not active against HIV-1 (EC_{50} value >100 μM) and was not antagonistic to the anti-HIV activity of abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir, or zidovudine. The absence of activity of telbivudine against HIV has not been evaluated in clinical trials.

Resistance

In an as-treated analysis of the Phase III global registration trial (NV-02B-007 GLOBE study), 59% (252/430) of treatment-naïve HBeAg-positive and 89% (202/227) of treatment-naïve HBeAg-negative subjects receiving telbivudine 600 mg once daily achieved non-detectable serum HBV DNA levels (<300 copies/mL) by Week 52. Of those who continued treatment beyond Week 52, 58% (243/418) and 85% (190/224) of HBeAg-positive and HBeAg-negative telbivudine recipients, respectively, had undetectable HBV DNA at Week 104 (or at the end of dosing in treatment Year 2).

The cumulative frequency of genotypic resistance (emergence of the rtM204I/V substitution) to telbivudine based on an as-treated analysis of HBeAg-positive and HBeAg-negative subjects at Weeks 52 and 104 was 7% and 22%, respectively. Genotypic analysis of paired baseline and telbivudine-treatment failure isolates from 182 evaluable subjects with amplifiable HBV DNA and ≥ 16 weeks of treatment showed that the rtM204I/V substitution was associated with virologic failure (HBV DNA $\geq 1,000$ copies/mL) and virologic rebound (≥ 1 \log_{10} increase above nadir). The rtM204I substitution was the most frequent substitution, detectable in isolates from 143/182 (79%) of evaluable subjects, and was frequently found with substitutions rtL80I/V and rtL180M. The rtM204I substitution was found infrequently with rtV27A, rtL82M, rtV173L, rtT184I/S, rtA200V, rtL229F/V/W, and rtR289K substitutions. The HBV of 16 subjects developed rtA181S/T amino acid substitutions while receiving telbivudine. Eight of these 16 subjects had outgrowth of HBV expressing an rtM204I/V substitution without the rtA181 substitution and 1 subject's HBV had both the rtM204I and rtA181T substitutions.

Subjects with higher baseline viral load had higher rates of genotypic resistance to telbivudine, while subjects who achieved HBV DNA levels <300 copies/mL at Week 24 had lower rates of genotypic resistance to telbivudine. By Week 104, 32% (95/293) of HBeAg-positive subjects with baseline viral DNA levels ≥ 9 \log_{10} copies/mL developed genotypic resistance to telbivudine, compared to 15% (20/136) of the subjects with viral DNA levels <9 \log_{10} copies/mL. In HBeAg-negative subjects, 17% (22/132) of the subjects with baseline viral DNA levels ≥ 7 \log_{10} copies/mL developed genotypic resistance to telbivudine, compared to 5% (5/95) of the subjects with viral DNA levels <7 \log_{10} copies/mL. By Week 104, 41% (97/239) of HBeAg-positive subjects who failed to achieve viral DNA levels <300 copies/mL at Week 24 developed genotypic resistance to telbivudine, compared to 9% (18/190) of the subjects with non-detectable serum HBV DNA levels (<300 copies/mL) at Week 24. In HBeAg-negative subjects, 35% (15/43) of the subjects who failed to achieve viral DNA levels <300 copies/mL at Week 24 developed genotypic resistance to telbivudine, compared to 7% (12/184) of the subjects with non-detectable serum HBV DNA levels (<300 copies/mL) at Week 24.

Cross-Resistance

Cross-resistance has been observed among HBV nucleoside analogues. In cell-based assays, lamivudine-resistant HBV strains expressing either the rtM204I substitution or the rtL180M/rtM204V double substitution had $\geq 1,000$ -fold reduced susceptibility to telbivudine. Telbivudine retained wild-type phenotypic activity (1.2-fold reduction) against the lamivudine resistance-associated substitution rtM204V alone. The efficacy of telbivudine against HBV harboring the rtM204V substitution has not been established in clinical trials.

HBV encoding the adefovir resistance-associated substitution rtA181V showed 3- to 5- fold reduced susceptibility to telbivudine in cell culture. The rtA181S and rtA181T substitutions conferred 2.7- and 3.5-fold reductions in susceptibility to telbivudine, respectively. The rtA181T substitution is associated with decreased clinical response in patients with HBV treated with adefovir and entecavir. HBV encoding the adefovir resistance-associated substitution rtN236T remained susceptible to telbivudine.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Telbivudine has shown no carcinogenic potential. Long term oral carcinogenicity studies with telbivudine were negative in mice and rats at exposures up to 14 times those observed in humans at the therapeutic dose of 600 mg/day.

There was no evidence of genotoxicity based on *in-vitro* or *in-vivo* tests. Telbivudine was not mutagenic in the Ames bacterial reverse mutation assay using *S. typhimurium* and *E. coli* strains with or without metabolic activation. Telbivudine was not clastogenic in mammalian-cell gene mutation assays, including human lymphocyte cultures and an assay with Chinese hamster ovary cells with or without metabolic activation. Furthermore, telbivudine showed no effect in an *in-vivo* micronucleus study in mice.

In reproductive toxicology studies, no evidence of impaired fertility was seen in male or female rats at systemic exposures approximately 14 times that achieved in humans at the therapeutic dose.

14 CLINICAL STUDIES

14.1 Clinical Experience in Nucleoside-Naïve Adults

The safety and efficacy of long-term (104-week) telbivudine treatment were evaluated in one active-controlled, clinical study (NV-02B-007 GLOBE Study) that included 1,367 subjects with chronic hepatitis B and a smaller supportive study (NV-02B-015) that included 332 subjects. Subjects were 16 years of age or older, with chronic hepatitis B, evidence of HBV infection with viral replication (HBsAg-positive, HBeAg-positive or HBeAg-negative, HBV DNA detectable by a PCR assay), and elevated ALT levels ≥ 1.3 times the upper limit of normal (ULN), no evidence of hepatic decompensation, and chronic inflammation on liver biopsy compatible with chronic viral hepatitis.

NV-02B-007 GLOBE Study

The Week 52 and Week 104 results of the 007 GLOBE study are summarized below.

The 007 GLOBE study was a Phase III, randomized, double-blind, multinational study of telbivudine 600 mg once daily compared to lamivudine 100 mg once daily for a treatment period of 104 weeks in 1,367 (n= 680 telbivudine; n=687 lamivudine) nucleoside-naïve chronic hepatitis B HBeAg-positive and HBeAg-negative subjects. The primary data analysis was conducted after all subjects had reached Week 52.

HBeAg-positive Subjects: (n= 458 telbivudine; n= 463 lamivudine) The mean age of subjects was 32 years, 74% were male, 82% were Asian, 12% were Caucasian, and 6% had previously received alfa-interferon therapy. At baseline, subjects had a mean Knodell Necroinflammatory Score ≥ 7 ; mean serum HBV DNA as measured by Roche COBAS Amplicor[®] PCR assay was 9.52 log₁₀ copies/mL; and mean serum ALT was 153 IU/L. Pre- and post-liver biopsy samples were adequate for 86% of subjects.

HBeAg-negative Subjects: (n=222 telbivudine; n= 224 lamivudine) The mean age of subjects was 43 years, 77% were male, 65% were Asian, 23% were Caucasian, and 11% had previously received alfa-interferon therapy. At baseline, subjects had a mean Knodell Necroinflammatory Score ≥ 7 ; mean serum HBV DNA as measured by Roche COBAS Amplicor[®] PCR assay was 7.54 log₁₀ copies/mL; and mean serum ALT was 140 IU/L. Pre- and post-liver biopsy samples were adequate for 92% of subjects.

Clinical Results

Clinical and virologic efficacy endpoints were evaluated separately in the HBeAg-positive and HBeAg-negative subject populations.

The primary endpoint of Therapeutic Response at Week 52 was a composite endpoint requiring suppression of HBV DNA to $< 5 \log_{10}$ copies/mL in conjunction with either loss of serum HBeAg or ALT normalization. Key secondary endpoints included histologic response, ALT normalization, and measures of virologic response.

At Week 52, in HBeAg-positive patients, 75% of telbivudine subjects and 67% of lamivudine subjects had a Therapeutic Response; in HBeAg-negative patients 75% of telbivudine subjects and 77% of lamivudine subjects had a Therapeutic Response.

Analysis of the histological response at Week 52 is shown in Table 5.

Table 5 Histological Improvement and Change in Ishak Fibrosis Score at Week 52 (007 GLOBE Study)

	HBeAg-positive (n=797)		HBeAg-negative (n=417)	
	Telbivudine 600 mg (n=399) ¹	Lamivudine 100 mg (n=398) ¹	Telbivudine 600 mg (n=205) ¹	Lamivudine 100 mg (n=212) ¹
Histologic Response²				
Improvement	69%	60%	69%	68%
No Improvement	19%	26%	23%	25%
Missing Week 52 Biopsy	12%	15%	8%	7%
Ishak Fibrosis Score³				
Improvement	41%	46%	48%	44%
No Change	39%	32%	34%	43%
Worsening	9%	7%	10%	5%
Missing Week 52 Biopsy	12%	15%	8%	7%

¹ Patients with \geq one dose of study drug with evaluable baseline liver biopsies and baseline Knodell Necroinflammatory Score ≥ 2

² Histologic Response defined as ≥ 2 point decrease in Knodell Necroinflammatory Score from baseline with no worsening of the Knodell Fibrosis Score

³ For Ishak Fibrosis Score, improvement defined as a ≥ 1 -point reduction in Ishak Fibrosis Score from baseline to Week 52

Subjects were eligible to continue blinded treatment to Week 104. In the ITT population, 624/680 (92%) telbivudine recipients and 599/687 (87%) lamivudine recipients completed study treatment to Week 104. At Week 104, in HBeAg-positive patients, 63% of telbivudine subjects and 48% of lamivudine subjects had a Therapeutic Response, while in HBeAg-negative patients 78% of telbivudine subjects and 66% of lamivudine subjects had a Therapeutic Response.

Selected virologic, biochemical, and serologic outcome measures at Weeks 52 and 104 are shown in Table 6.

Table 6 Virological, Biochemical and Serologic Endpoints at Weeks 52 and 104 (007 GLOBE Study)

Response Parameter	HBeAg-positive (n=921)		HBeAg-negative (n=446)	
	Telbivudine 600 mg (n=458)	Lamivudine 100 mg (n=463)	Telbivudine 600 mg (n=222)	Lamivudine 100 mg (n=224)

	Week 52	Week 104	Week 52	Week 104	Week 52	Week 104	Week 52	Week 104
Mean HBV DNA Reduction from Baseline (log ₁₀ copies/mL) ± SEM ¹	-6.45 (0.11)	-5.74 (0.15)	-5.54 (0.11)	-4.42 (0.15)	-5.23 (0.13)	-5.00 (0.15)	-4.40 (0.13)	-4.17 (0.16)
% Subjects HBV DNA Negative by PCR	60%	56%	40%	39%	88%	82%	71%	57%
ALT Normalization ²	77%	70%	75%	62%	74%	78%	79%	70%
HBeAg Seroconversion ³	23%	30%	22%	25%	NA	NA	NA	NA
HBeAg Loss ³	26%	35%	23%	29%	NA	NA	NA	NA

¹ Roche COBAS AmpliCor® Assay (LLOQ≤300 copies/mL)

² ALT normalization assessed only in subjects with ALT > ULN at baseline.

³ HBeAg seroconversion and loss assessed only in subjects with detectable HBeAg at baseline.

Patients who achieved non-detectable HBV DNA levels at 24 weeks were more likely to undergo e-antigen seroconversion, achieve undetectable levels of HBV DNA, normalize ALT, and were less likely to develop resistance at one and two years.

Study NV-02B-015

The efficacy results of the 007 GLOBE study were supported by results of study NV-02B-015. This was a Phase III, randomized, double-blind, study of telbivudine 600 mg once daily compared to lamivudine 100 mg once daily for a treatment period of 104 weeks in 332 (n=167 telbivudine; n=165 lamivudine) nucleoside-naïve chronic hepatitis B HBeAg-positive and HBeAg-negative Chinese subjects. The primary efficacy endpoint was serum HBV DNA reduction from baseline. In this study the composite endpoint Therapeutic Response was a key secondary endpoint. Histological response was not assessed as an outcome measure in this study.

Clinical Results

Among HBeAg-positive subjects (n=147 telbivudine; n= 143 lamivudine) results for key endpoints at Week 104 included Therapeutic Response (66% vs. 41%), mean HBV DNA reduction (-5.47 vs. -3.97 log₁₀ copies/mL), HBV DNA PCR negativity (58% vs. 34%), ALT normalization (73% vs. 59%), HBeAg loss (40% vs. 28%) and HBeAg seroconversion (29% vs. 20%), for telbivudine and lamivudine, respectively. Because the number of HBeAg-negative subjects in this study was small (n=42), definitive conclusions could not be drawn regarding efficacy outcomes in this subpopulation.

16 HOW SUPPLIED/STORAGE AND HANDLING

Tablets

Tyzeka 600-mg tablets are white to slightly yellowish film-coated, ovaloid-shaped tablets, imprinted with “LDT” on one side.

Bottle of 30 tablets (NDC 0078-0538-15) with child-resistant closure.

Store Tyzeka tablets in original container at 25°C (77°F), excursions permitted to 15-30°C (59-86°F) [see USP Controlled Room Temperature].

For all medical inquiries call: 1-877-8-Tyzeka (1-877-889-9352).

Keep this and all drugs out of the reach of children.

17 PATIENT COUNSELING INFORMATION

See Medication Guide (17.2)

17.1 Instructions for Patients

Patients should remain under the care of a physician while taking Tyzeka. They should discuss any new symptoms or concurrent medications with their physician.

Patients should be advised to report promptly unexplained muscle weakness, tenderness or pain.

Patients should be advised to report promptly any numbness, tingling, and/or burning sensations in the arms and/or legs, with or without difficulty walking.

Patients should be advised that Tyzeka is not a cure for hepatitis B, that the long-term treatment benefits of telbivudine are unknown at this time. In particular, the relationship of initial treatment response to outcomes such as hepatocellular carcinoma and decompensated cirrhosis is unknown.

Patients should be informed that deterioration of liver disease may occur in some cases if treatment is discontinued, and that they should discuss any change in regimen with their physician.

Patients should be advised that treatment with Tyzeka has not been shown to reduce the risk of transmission of HBV to others through sexual contact or blood contamination. HBV prevention strategies should be discussed with patients, including safe sexual practices, and avoidance of needle sharing or sharing any personal items which may contain residual blood or body fluids, such as razor blades or toothbrushes. Additionally, a vaccine is available for prevention of hepatitis B infection in susceptible individuals.

Patients should be advised to dispose of unused or expired Tyzeka tablets by using a community pharmaceutical take-back disposal program, or by placing unused Tyzeka tablets in a closed container, such as a sealed bag, into household trash. All identifying information should be removed from the original Tyzeka container prior to disposal.

17.2 FDA Approved Patient Labeling

MEDICATION GUIDE

Tyzeka® (Tie-zee'-ka) (telbivudine) Tablets

Read this Medication Guide carefully before you start taking Tyzeka. Read the Medication Guide each time you refill your prescription in case new information has been included. The information contained in this Medication Guide does not take the place of talking with your healthcare provider about your medical condition or treatment.

What is the most important information I should know about Tyzeka?

Tyzeka can cause serious side effects, including:

Lactic Acidosis (build-up of an acid in the blood). Lactic acidosis can occur in people who take medicines like Tyzeka (a nucleoside analogue). Lactic acidosis is a serious medical emergency that can lead to death. Lactic acidosis must be treated in the hospital. Women, and people who are obese, or who have taken nucleoside analogues like Tyzeka for long periods of time may be at higher risk for lactic acidosis.

Lactic acidosis can be hard to identify early, because the symptoms could seem like symptoms of other health problems. Call your healthcare provider right away if you get any of the following symptoms which could be signs of lactic acidosis:

- You feel very weak or tired.
- You have unusual (not normal) muscle pain.
- You have trouble breathing.
- You have stomach pain with nausea and vomiting.
- You feel cold, especially in your arms and legs.
- You feel dizzy or light-headed.
- You have a fast or irregular heartbeat.

Liver problems. Serious liver problems have occurred in some people who take medicines like Tyzeka. This includes liver enlargement (hepatomegaly) and fat in the liver (steatosis).

Call your healthcare provider right away if you get any of these signs of liver problems:

- Your skin or the white part of your eyes turns yellow (jaundice).
- Your urine turns dark.
- Your bowel movements (stools) turn light in color.
- You do not feel like eating food for several days or longer.
- You feel sick to your stomach (nausea).
- You have lower stomach pain.

Muscle problems (myopathy). Tyzeka can cause muscle problems, including unexplained muscle pain, muscle weakness or muscle tenderness. Serious muscle problems can occur, including muscle breakdown (rhabdomyolysis). Muscle breakdown can lead to kidney damage. Tell your healthcare provider right away if you have unexplained muscle aches, pain, tenderness, or weakness.

Nerve problems. People who take Tyzeka alone or with the injectable medicine Pegasys[®] (pegylated interferon alfa-2a) or any type of injectable interferon product can have nerve problems such as continuing numbness, tingling, burning sensations in the arms or legs (peripheral neuropathy), or problems walking. Call your healthcare provider right away if you have any of these symptoms.

If you take Tyzeka with Pegasys[®] (pegylated interferon alfa-2a) or any type of injectable interferon product, your chance of having nerve problems may be higher and the nerve problems may be more severe. Be sure to tell your healthcare provider or pharmacist if you are also being treated with any type of injectable interferon for chronic hepatitis B or C. Check with your healthcare provider if you are not sure whether you are taking an injectable interferon product.

Worsening of your hepatitis B infection. Your hepatitis B infection may get worse or become very serious if you stop taking Tyzeka.

- Take your Tyzeka exactly as prescribed.
- Do not let your Tyzeka run out. Refill your prescription or talk to your healthcare provider before your Tyzeka is all gone.

- Do not stop taking your Tyzeka without talking to your healthcare provider.

Your health care provider will need to monitor your health and do regular blood tests to check your liver if you stop taking Tyzeka. Tell your healthcare provider right away about any new or unusual symptoms that happen after you stop taking Tyzeka.

What is Tyzeka?

Tyzeka is a prescription medicine used for chronic infection with hepatitis B virus (HBV) in people 16 years of age and older who also have active liver damage.

- Tyzeka will not cure HBV.
- Tyzeka may lower the amount of HBV in the body.
- Tyzeka may lower the ability of HBV to multiply and infect new liver cells.
- Tyzeka may improve the condition of your liver.

It is not known if Tyzeka is safe and effective in children younger than age 16.

What should I tell my healthcare provider before I take Tyzeka?

Tell your healthcare provider about all of your medical conditions, including if you:

- have kidney problems. You may need a lower dose of Tyzeka.
- have any allergies.
- are pregnant or planning to become pregnant. It is not known if Tyzeka is safe to use during pregnancy. It is not known whether Tyzeka helps prevent a pregnant mother from passing HBV to her baby. You and your healthcare provider will need to decide if Tyzeka is right for you. If you use Tyzeka while you are pregnant, talk to your healthcare provider.
- are breast-feeding. It is not known if Tyzeka can pass into your breast milk or if it can harm your baby. Do not breast-feed if you are taking Tyzeka.

Tell your healthcare provider about all the medicines you take including prescription and nonprescription medicines, vitamins, and herbal supplements. Tyzeka may interact with other medicines that leave the body through the kidneys.

Especially tell your healthcare provider or pharmacist if you are also being treated with Pegasys[®] (pegylated interferon alfa-2a), or any type of injectable interferon product for chronic hepatitis B or C. (See “What is the most important information I should know about Tyzeka?”)

Know the medicines you take. Keep a list of your medicines with you to show your healthcare provider and pharmacist.

How should I take Tyzeka?

Tyzeka does not stop you from spreading HBV to others by sex, sharing needles, or being exposed to your blood. Talk with your healthcare provider about safe sexual practices that protect your partner. Never share needles. Do not share personal items that can have blood or body fluids on them, like toothbrushes or razor blades. A shot (vaccine) is available to protect people at risk from becoming infected with HBV, such as partners of patients with HBV.

- Take Tyzeka exactly as prescribed. Your healthcare provider will tell you how much Tyzeka to take. The usual dose of Tyzeka is one 600 mg tablet one time each day. Your dose may be lower if you have kidney problems.

- Tyzeka may be taken with or without food.
- To help you remember to take your Tyzeka, try to take it at the same time each day.
 - Do not change your dose or stop taking Tyzeka without talking to your healthcare provider first. See "What is the most important information I should know about Tyzeka?".
 - If you forget to take Tyzeka, take it as soon as you remember and then take your next dose at the regular time. If it is almost time for your next dose, skip the missed dose. Do not take two doses at the same time. Call your healthcare provider or pharmacist if you are not sure what to do.
 - If you take more than your prescribed dose of Tyzeka, call your healthcare provider right away.

It is important to stay under your healthcare provider's care while taking Tyzeka. Your healthcare provider will regularly test the level of the hepatitis B virus in your blood.

What are the possible side effects of Tyzeka?

Tyzeka can cause serious side effects. See "What is the most important information I should know about Tyzeka?".

Common side effects of Tyzeka include:

- tiredness
- headache
- cough
- diarrhea
- stomach (abdominal) pain
- nausea
- sore throat
- joint pain
- fever
- skin rash
- back pain
- dizziness
- muscle aches
- upset stomach
- trouble sleeping
- stomach area (abdominal) swelling
- certain abnormal blood tests

Tell your healthcare provider about any side effect that bothers you or that does not go away. These are not all the possible side effects of Tyzeka. Your healthcare provider or pharmacist can give you a more complete list.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store Tyzeka?

- Store Tyzeka Tablets in the original bottle at room temperature, 59° to 86° F (15° to 30° C). Do not store Tyzeka Tablets in a damp place such as a bathroom medicine cabinet or near the kitchen sink.
- Keep the bottle tightly closed.
- Throw away Tyzeka when it is outdated or no longer needed by taking Tyzeka to a community take-back disposal program, if available, or by placing Tyzeka tablets in a closed container (such as a sealed bag) in the household trash. Remove all identifying information from the original Tyzeka container before throwing it out.

Keep Tyzeka and all medicines out of the reach of children.

General information about Tyzeka

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use Tyzeka for a condition for which it was not prescribed. Do not give Tyzeka to other people, even if they have the same symptoms you have. It may harm them.

This Medication Guide summarizes the most important information about Tyzeka. If you would like more information, talk with your healthcare provider. You can ask your healthcare provider or pharmacist for information about Tyzeka that is written for healthcare professionals. For more information call 1-877-889-9352 or go to www.Tyzeka.com.

What are the ingredients in Tyzeka?

Active Ingredient: telbivudine

Inactive Ingredients: colloidal silicon dioxide, magnesium stearate, microcrystalline cellulose, povidone, sodium starch glycolate. The tablet coating contains titanium dioxide, polyethylene glycol, talc and hypromellose.
