

IX. Use in Special Populations

Pregnant women and mothers who are nursing a baby should avoid using IBU/PSE.

It is recognized that accidental overdose has been a cause of serious adverse events in children under the age of 12. The safety of the combination product in children under 12 years of age will be reviewed separately (See **Introduction and Background**).

The elderly may be at increased risk of experiencing serious adverse events from IBU/PSE because they are at increased risk from taking single ingredient IBU and single ingredient PSE.

Because this product contains IBU, use should be avoided in people with a history of gastrointestinal bleeding and peptic ulcer disease, allergies to other nonsteroidal anti-inflammatory drugs, and a history of pre-existing renal disease, congestive heart failure, and hypertension. Use should also be avoided in people taking anticoagulant medication.

Because this product contains PSE, use should be avoided in those with hyperthyroidism, diabetes mellitus, cardiovascular disease, increased intraocular pressure, prostatic hypertrophy, and hypertension.

X. Conclusions and Recommendations

Conclusion:

The data submitted in this NDA does not suggest any new safety signals associated with the use of combination IBU/PSE. However, some of the information from the databases is incomplete. Compared with the data for IBU/PSE, the data suggests that deaths and serious adverse events are more common with IBU and with PSE as single ingredients, than with the combination product. The data does not suggest a significant problem with abuse of IBU/PSE. The data does not suggest that combination product IBU/PSE, when taken according to the directions, is unsafe for OTC availability.

The AE databases for IBU, include prescription strength as well as OTC strength IBU as a single ingredient. The data does not suggest new safety signals for IBU, but it is unclear which AE's are associated with which doses. Allergy, gastrointestinal (ulcer and bleeding) and renal signals (which have been associated with IBU and are detailed in the prescription labeling) were again prominent in this data. The PSE single ingredient data does not suggest new signals.

The pharmacokinetics data does not suggest differences in bioequivalence with the tablet formulation that would be of clinical significance. The PK Data indicates that in a fed state the IBU may not reach therapeutic levels as quickly from the Liqui-Gel formulation compared with the tablet formulation (therapeutic levels are reached in approximately 45 minutes with the Liqui-Gel compared to 30 minutes with the tablet). However, safety concerns about gastrointestinal toxicity are a compelling reason to eliminate the sponsor's suggested direction, _____ from the product label.

The draft label for the NDA has deficiencies that can be addressed through the OTC drug monograph proposed rulemaking and/or FDA appointed advisory committee processes.

Recommendations:

The data suggest that, Advil® Cold & Sinus Liqui-Gels® should be safe for Over-the-Counter (OTC) availability if consumers use the product in accordance with the directions and warnings on the product label. Therefore the product could be approved for OTC use. However, the proposed label should be modified in the following ways:

- The label states, "relieves sinus — nasal congestion, and fever." _____
- Delete the statement, _____
- The label states "take with food or milk if stomach upset occurs." Taking non-steroidal anti-inflammatory drugs with milk may not prevent stomach pain. Further, if people experience stomach pain, it would be appropriate to stop taking the medication. It may be better to simply state _____

Because this product contains active ingredients that are regulated under both the OTC Monograph and NDA processes, consideration should be given to addressing the following labeling issues through the OTC drug monograph proposed rulemaking and/or FDA appointed advisory committee process. The need for a:

- More prominent gastrointestinal warning
- Renal warning
- Drug-drug interaction warning (e.g., anticoagulants)
- Glaucoma warning
