206829Orig1s000

PROPRIETARY NAME REVIEW(S)

Department of Health and Human Services Public Health Service Food and Drug Administration Center for Drug Evaluation and Research Office of Surveillance and Epidemiology Office of Medication Error Prevention and Risk Management

Proprietary Name Memorandum

Date:	May 28, 2014
Reviewer:	Aleksander Winiarski, PharmD Division of Medication Error Prevention and Analysis
Acting Team Leader	Tingting Gao, PharmD, BCPS Division of Medication Error Prevention and Analysis
Drug Name and Strength:	Zerbaxa (Ceftolozane/Tazobactam) for Injection, 1.5 g per vial
Application Type/Number:	NDA 206829
Applicant/Sponsor:	Cubist
OSE RCM #:	2014-17366

*** This document contains proprietary and confidential information that should not be released to the public.***

1 INTRODUCTION

The proposed proprietary name, Zerbaxa, was found acceptable in OSE Review# 2013-2129, dated February 21, 2014 under IND 104490. This memorandum is to communicate that DMEPA maintains the proposed proprietary name, Zerbaxa, is acceptable from both a promotional and safety perspective under NDA 206829.

If you have further questions or need clarification, please contact Karen Townsend, OSE project manager, at 301-796-5413.

1.1 COMMENTS TO THE APPLICANT

We have completed our review of the proposed proprietary name, Zerbaxa, and have concluded that this name is acceptable.

If any of the proposed product characteristics as stated in your May 16, 2014 submission are altered, the name must be resubmitted for review.

1 INTRODUCTION

This review evaluates the proposed proprietary name, Zerbaxa, from a safety and promotional perspective. The sources and methods used to evaluate the proposed name are outlined in the reference section and Appendix A respectively.

1.1 REGULATORY HISTORY

The Applicant submitted a request for proprietary name on September 16, 2013. Additionally, the Applicant submitted an external Proprietary Name Safety Summary conducted by the (b) (4) on September 13, 2013.

1.2 PRODUCT INFORMATION

The following product information is provided in the September 16, 2013 proprietary name submission.

- Intended Pronunciation: zer bax' ah
- Active Ingredient: ceftolozane/tazobactam
- Indication of Use:
 - complicated urinary tract infections caused by *Pseudomonas aeruginosa*, *Escherichia coli*, *Klebsiella pneumoniae*,
 ^{(b) (4)} and *Proteus mirabilis*
 - complicated intra-abdominal infections (used in combination with metronidazole) caused by *Pseudomonas aeruginosa, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Bacteroides fragilis,* and *Streptococcus spp.*
- Route of Administration: intravenous
- Dosage Form: powder for injection
- Strength: 1.5 g
- Dose and Frequency: 1.5 g intravenous infusion over 1 hour every 8 hours for 4 to 14 days; requires renal dose adjustment
- How Supplied: single use vials containing 1.5 g
- Storage: diluted solution in the infusion bag can be stored at room temperature for (b) (4) (or (b) (4) at 2-8°C)

2 RESULTS

The following sections provide information obtained and considered in the overall evaluation of the proposed proprietary name.

2.1 **PROMOTIONAL ASSESSMENT**

The Office of Prescription Drug Promotion OPDP determined the proposed name is acceptable from a promotional perspective. DMEPA and the Division of Anti-Infective

Products concurred with the findings of OPDP's promotional assessment of the proposed name.

2.2 SAFETY ASSESSMENT

The following aspects were considered in the safety evaluation of the name.

2.2.1 United States Adopted Names (USAN) SEARCH

The October 2, 2013 search of the United States Adopted Name (USAN) stems did not identify that a USAN stem is present in the proposed proprietary name.

2.2.2 Components of the Proposed Proprietary Name

The Applicant indicated in their submission that the proposed name, Zerbaxa, has no derivation or intended meaning. This proprietary name is comprised of a single word that does not contain any components (i.e. a modifier, route of administration, dosage form, etc.) that are misleading or can contribute to medication error.

2.2.3 FDA Name Simulation Studies

Sixty-three practitioners participated in DMEPA's prescription studies. The interpretations did not overlap with any currently marketed products nor did the misinterpretations sound or look similar to any currently marketed products or any products in the pipeline.

In the written outpatient study, none of the 23 participants correctly interpreted the prescription. Common misinterpretations in the written outpatient study were substitution of 'L' for 'Z', 's' or 'v' for 'r' and 'e' for 'a'. In the written inpatient study, 6 of 20 participants correctly interpreted the prescription. One misinterpretation in the written inpatient study was substitution of 'i' or 's' for 'r'. In the voice study, 5 of 20 participants correctly interpreted the prescription. Common misinterpretations in the voice study, 5 of 20 participants correctly interpreted the prescription. Common misinterpretations in the voice study include: 'y' for 'e' and 'S' for 'Z'.

We have considered these variations in our look-alike and sound-alike searches and analysis (see Appendix B). See Appendix C for the complete listing of interpretations from the verbal and written prescription studies.

2.2.4 Comments from Other Review Disciplines at Initial Review

In response to the OSE, October 2, 2013 e-mail, the Division of Anti-Infective Products (DAIP) did not forward any comments or concerns relating to the proposed proprietary name at the initial phase of the review.

2.2.5 Failure Mode and Effects Analysis of Similar Names

Appendix B lists possible orthographic and phonetic misinterpretations of the letters appearing in the proposed proprietary name, Zerbaxa. Table 1 lists the names with orthographic, phonetic, or spelling similarity to the proposed proprietary name, Zerbaxa identified by the primary reviewer, the Expert Panel Discussion (EPD), and other review disciplines. Table 1 also includes the names identified by the not identified by DMEPA and requires further evaluation.

Table 1: Collective List of Potentially Similar Names (DMEPA, Expert Panel Discussion (EPD), Other Disciplines, and External Name Study)					
Name	Source	Name	Source	Name	Source
	-	Look Sim	ilar		
Zetonna	FDA	Forfivo	FDA	Cerebyx	FDA
Surbex	FDA	(b) (4)	FDA	Zolinza	FDA
Zebeta	FDA/ ^{(b) (4)}	^{(b) (4)} Error! Bookmark not defined.	FDA	Fentora	FDA
Zubsolv	FDA	Zorbtive	FDA	Unasyn	FDA
Cetraxal	FDA	Zelapar	(b) (4)	Zosyn	FDA
Verdeso	FDA	Zetia	(b) (4)		
		Sound Sin	nilar		
Bactrim	(b) (4)	Serpasil	(b) (4)	Paxil	(b) (4)
Cervarix	(b) (4)	Zavesca	(b) (4)		
Look and Sound Similar					
Pradaxa	FDA/ ^{(b) (4)}	Zirgan	(b) (4)	Abraxane	(b) (4)
Zyprexa	FDA/ ^{(b) (4)}	Zervalx	FDA/ ^{(b) (4)}	Celexa	(b) (4)
Cymbalta	(b) (4)	Zovirax	(b) (4)	Robaxin	(b) (4)
Suboxone	(b) (4)	Zithromax	(b) (4)		

(b) (4)

Our analysis of the thirty-three names contained in Table 1 considered the information obtained in the previous sections along with their product characteristics. We determined thirty-three names will not pose a risk for confusion as described in Appendices D through E.

2.2.6 Communication of DMEPA's Analysis at Midpoint of Review

DMEPA communicated our findings to the Division of Anti-Infective Products via e-mail on February 12, 2014. At that time we also requested additional information or concerns that could inform our review. Per e-mail correspondence from the Division of Anti-Infective Products on February 20, 2014, they stated no additional concerns with the proposed proprietary name, Zerbaxa.

^{***} This document contains proprietary and confidential information that should not be released to the public.

3 CONCLUSIONS

The proposed proprietary name is acceptable from both a promotional and safety perspective.

If you have further questions or need clarifications, please contact Karen Townsend, OSE project manager, at 301-796-5413.

3.1 COMMENTS TO THE APPLICANT

We have completed our review of the proposed proprietary name, Zerbaxa, and have concluded that this name is acceptable.

If any of the proposed product characteristics as stated in your September 16, 2013 submission are altered, the name must be resubmitted for review.

1. Micromedex Integrated Index (<u>http://csi.micromedex.com</u>)

Micromedex contains a variety of databases covering pharmacology, therapeutics, toxicology and diagnostics.

2. Phonetic and Orthographic Computer Analysis (POCA)

POCA is a database which was created for the Division of Medication Error Prevention and Analysis, FDA. As part of the name similarity assessment, proposed names are evaluated via a phonetic/orthographic algorithm. The proposed proprietary name is converted into its phonemic representation before it runs through the phonetic algorithm. Likewise, an orthographic algorithm exists which operates in a similar fashion.

 Drug Facts and Comparisons, online version, St. Louis, MO (<u>http://factsandcomparisons.com</u>)

Drug Facts and Comparisons is a compendium organized by therapeutic course; it contains monographs on prescription and OTC drugs, with charts comparing similar products. This database also lists the orphan drugs.

Natural Standard is a resource that aggregates and synthesizes data on complementary and alternative medicine.

APPENDICES

<u>Appendix A</u>

FDA's Proprietary Name Risk Assessment considers the promotional and safety aspects of a proposed proprietary name. The promotional review of the proposed name is conducted by OPDP. OPDP evaluates proposed proprietary names to determine if they are overly fanciful, so as to misleadingly imply unique effectiveness or composition, as well as to assess whether they contribute to overstatement of product efficacy, minimization of risk, broadening of product indications, or making of unsubstantiated superiority claims. OPDP provides their opinion to DMEPA for consideration in the overall acceptability of the proposed proprietary name.

The safety assessment is conducted by DMEPA. DMEPA staff search a standard set of databases and information sources to identify names that are similar in pronunciation, spelling, and orthographically similar when scripted to the proposed proprietary name. Additionally, we consider inclusion of USAN stems or other characteristics that when incorporated into a proprietary name may cause or contribute to medication errors (i.e., dosing interval, dosage form/route of administration, medical or product name abbreviations, names that include or suggest the composition of the drug product, etc.). DMEPA defines a medication error as any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer.¹

Following the preliminary screening of the proposed proprietary name, DMEPA gathers to discuss their professional opinions on the safety of the proposed proprietary name. This meeting is commonly referred to the Center for Drug Evaluation and Research (CDER) Expert Panel discussion. DMEPA also considers other aspects of the name that may be misleading from a safety perspective. DMEPA staff conducts a prescription simulation studies using FDA health care professionals. When provided, DMEPA considers external proprietary name studies conducted by or for the Applicant/Sponsor and incorporates the findings of these studies into the overall risk assessment.

The DMEPA primary reviewer assigned to evaluate the proposed proprietary name is responsible for considering the collective findings, and provides an overall risk assessment of the proposed proprietary name. DMEPA bases the overall risk assessment on the findings of a Failure Mode and Effects Analysis (FMEA) of the proprietary name and misleading nature of the proposed proprietary name with a focus on the avoidance of medication errors.

DMEPA uses the clinical expertise of its staff to anticipate the conditions of the clinical setting where the product is likely to be used based on the characteristics of the proposed product. DMEPA considers the product characteristics associated with the proposed product throughout the risk assessment because the product characteristics of the proposed may provide a context for communication of the drug name and ultimately determine the use of the product in the *usual* clinical practice setting.

¹ National Coordinating Council for Medication Error Reporting and Prevention. <u>http://www.nccmerp.org/aboutMedErrors.html</u>. Last accessed 10/11/2007.

Typical product characteristics considered when identifying drug names that could potentially be confused with the proposed proprietary name include, but are not limited to; established name of the proposed product, proposed indication of use, dosage form, route of administration, strength, unit of measure, dosage units, recommended dose, typical quantity or volume, frequency of administration, product packaging, storage conditions, patient population, and prescriber population. DMEPA considers how these product characteristics may or may not be present in communicating a product name throughout the medication use system. Because drug name confusion can occur at any point in the medication use process, DMEPA considers the potential for confusion throughout the entire U.S. medication use process, including drug procurement, prescribing and ordering, dispensing, administration, and monitoring the impact of the medication.²

The DMEPA considers the spelling of the name, pronunciation of the name when spoken, and appearance of the name when scripted. DMEPA compares the proposed proprietary name with the proprietary and established name of existing and proposed drug products and names currently under review at the FDA. DMEPA compares the pronunciation of the proposed proprietary name with the pronunciation of other drug names because verbal communication of medication names is common in clinical settings. DMEPA examines the phonetic similarity using patterns of speech. If provided, DMEPA will consider the Sponsor's intended pronunciation of the proprietary name. However, DMEPA also considers a variety of pronunciations that could occur in the English language because the Sponsor has little control over how the name will be spoken in clinical practice. The orthographic appearance of the proposed name is evaluated using a number of different handwriting samples. DMEPA applies expertise gained from root-cause analysis of postmarketing medication errors to identify sources of ambiguity within the name that could be introduced when scripting (e.g., "T" may look like "F," lower case 'a' looks like a lower case 'u,' etc.). Additionally, other orthographic attributes that determine the overall appearance of the drug name when scripted (see Table 1 below for details).

² Institute of Medicine. Preventing Medication Errors. The National Academies Press: Washington DC. 2006.

	Considerations when Searching the Databases			
Type of Similarity	Potential Causes of Drug Name Similarity	Attributes Examined to Identify Similar Drug Names	Potential Effects	
Look- alike	Similar spelling	Identical prefix Identical infix Identical suffix Length of the name Overlapping product characteristics	 Names may appear similar in print or electronic media and lead to drug name confusion in printed or electronic communication Names may look similar when scripted and lead to drug name confusion in written communication 	
	Orthographic similarity	Similar spelling Length of the name/Similar shape Upstrokes Down strokes Cross-strokes Dotted letters Ambiguity introduced by scripting letters Overlapping product characteristics	• Names may look similar when scripted, and lead to drug name confusion in written communication	
Sound- alike	Phonetic similarity	Identical prefix Identical infix Identical suffix Number of syllables Stresses Placement of vowel sounds Placement of consonant sounds Overlapping product characteristics	• Names may sound similar when pronounced and lead to drug name confusion in verbal communication	

Table 1. Criteria Used to Identify Drug Names that Look- or Sound-Similar to a Proposed Proprietary Name.

Lastly, DMEPA considers the potential for the proposed proprietary name to inadvertently function as a source of error for reasons other than name confusion. Postmarketing experience has demonstrated that proprietary names (or components of the proprietary name) can be a source of error in a variety of ways. Consequently, DMEPA considers and evaluates these broader safety implications of the name throughout this assessment and the medication error staff provides additional comments related to the safety of the proposed proprietary name or product based on professional experience with medication errors.

1. Database and Information Sources

DMEPA searches the internet, several standard published drug product reference texts, and FDA databases to identify existing and proposed drug names that may sound-alike or look-alike to the proposed proprietary name. A standard description of the databases used in the searches is provided in the reference section of this review. To complement the process, the DMEPA uses a computerized method of identifying phonetic and orthographic similarity between medication names. The program, Phonetic and Orthographic Computer Analysis (POCA), uses complex algorithms to select a list of names from a database that have some similarity (phonetic, orthographic, or both) to the trademark being evaluated. Lastly, DMEPA reviews the USAN stem list to determine if any USAN stems are present within the proprietary name. The individual findings of multiple safety evaluators are pooled and presented to the CDER Expert Panel. DMEPA also evaluates if there are characteristics included in the composition that may render the name unacceptable from a safety perspective (abbreviation, dosing interval, etc.).

2. Expert Panel Discussion

DMEPA gathers gather CDER professional opinions on the safety of the proposed product and discussed the proposed proprietary name (Expert Panel Discussion). The Expert Panel is composed of Division of Medication Errors Prevention (DMEPA) staff and representatives from the Office of Prescription Drug Promotion (OPDP). We also consider input from other review disciplines (OND, ONDQA/OBP). The Expert Panel also discusses potential concerns regarding drug marketing and promotion related to the proposed names.

The primary Safety Evaluator presents the pooled results of the database and information searches to the Expert Panel for consideration. Based on the clinical and professional experiences of the Expert Panel members, the Panel may recommend additional names, additional searches by the primary Safety Evaluator to supplement the pooled results, or general advice to consider when reviewing the proposed proprietary name.

3. FDA Prescription Simulation Studies

Three separate studies are conducted within the Centers of the FDA for the proposed proprietary name to determine the degree of confusion of the proposed proprietary name with marketed U.S. drug names (proprietary and established) due to similarity in visual appearance with handwritten prescriptions or verbal pronunciation of the drug name. The studies employ healthcare professionals (pharmacists, physicians, and nurses), and attempts to simulate the prescription ordering process. The primary Safety Evaluator uses the results to identify orthographic or phonetic vulnerability of the proposed name to be misinterpreted by healthcare practitioners.

In order to evaluate the potential for misinterpretation of the proposed proprietary name in handwriting and verbal communication of the name, inpatient medication orders and/or outpatient prescriptions are written, each consisting of a combination of marketed and unapproved drug products, including the proposed name. These orders are optically scanned and one prescription is delivered to a random sample of participating health professionals via e-mail. In addition, a verbal prescription is recorded on voice mail. The voice mail messages are then sent to a random sample of the participating health professionals for their interpretations and review. After receiving either the written or verbal prescription orders, the participants record their interpretations of the orders which are recorded electronically.

4. Comments from Other Review Disciplines

DMEPA requests the Office of New Drugs (OND) and/or Office of Generic Drugs (OGD), ONDQA or OBP for their comments or concerns with the proposed proprietary name, ask for any clinical issues that may impact the DMEPA review during the initial phase of the name review. Additionally, when applicable, at the same time DMEPA requests concurrence/non-concurrence with OPDP's decision on the name. The primary Safety Evaluator addresses any comments or concerns in the safety evaluator's assessment.

The OND/OGD Regulatory Division is contacted a second time following our analysis of the proposed proprietary name. At this point, DMEPA conveys their decision to accept or reject the name. The OND or OGD Regulatory Division is requested to provide any further information that might inform DMEPA's final decision on the proposed name.

Additionally, other review disciplines opinions such as ONDQA or OBP may be considered depending on the proposed proprietary name.

5. Safety Evaluator Risk Assessment of the Proposed Proprietary Name

The primary Safety Evaluator applies his/her individual expertise gained from evaluating medication errors reported to FDA, considers all aspects of the name that may be misleading or confusing, conducts a Failure Mode and Effects Analysis, and provides an overall decision on acceptability dependent on their risk assessment of name confusion. Failure Mode and Effects Analysis (FMEA) is a systematic tool for evaluating a process and identifying where and how it might fail.³ When applying FMEA to assess the risk of a proposed proprietary name, DMEPA seeks to evaluate the potential for a proposed proprietary name to be confused with another drug name because of name confusion and, thereby, cause errors to occur in the medication errors associated with drug name confusion. FMEA allows the Agency to identify the potential for medication errors due to orthographically or phonetically similar drug names prior to approval, where actions to overcome these issues are easier and more effective than remedies available in the post-approval phase.

In order to perform an FMEA of the proposed name, the primary Safety Evaluator must analyze the use of the product at all points in the medication use system. Because the proposed product is has not been marketed, the primary Safety Evaluator anticipates the use of the product in the usual practice settings by considering the clinical and product

³ Institute for Healthcare Improvement (IHI). Failure Mode and Effects Analysis. Boston. IHI:2004.

characteristics listed in Section 1.2 of this review. The Safety Evaluator then analyzes the proposed proprietary name in the context of the usual practice setting and works to identify potential failure modes and the effects associated with the failure modes.

In the initial stage of the Risk Assessment, the Safety Evaluator compares the proposed proprietary name to all of the names gathered from the above searches, Expert Panel Discussion, and prescription studies, external studies, and identifies potential failure modes by asking:

"Is the proposed proprietary name convincingly similar to another drug name, which may cause practitioners to become confused at any point in the usual practice setting? And are there any components of the name that may function as a source of error beyond sound/look-alike?"

An affirmative answer indicates a failure mode and represents a potential for the proposed proprietary name to be confused with another proprietary or established drug name because of look- or sound-alike similarity or because of some other component of the name. If the answer to the question is no, the Safety Evaluator is not convinced that the names possess similarity that would cause confusion at any point in the medication use system, thus the name is eliminated from further review.

In the second stage of the Risk Assessment, the primary Safety Evaluator evaluates all potential failure modes to determine the likely *effect* of the drug name confusion, by asking:

"Could the confusion of the drug names conceivably result in medication errors in the usual practice setting?"

The answer to this question is a central component of the Safety Evaluator's overall risk assessment of the proprietary name. If the Safety Evaluator determines through FMEA that the name similarity would not ultimately be a source of medication errors in the usual practice setting, the primary Safety Evaluator eliminates the name from further analysis. However, if the Safety Evaluator determines through FMEA that the name similarity could ultimately cause medication errors in the usual practice setting, the Safety Evaluator determines through FMEA that the name similarity could ultimately cause medication errors in the usual practice setting, the Safety Evaluator will then recommend the use of an alternate proprietary name.

Moreover, DMEPA will object to the use of proposed proprietary name when the primary Safety Evaluator identifies one or more of the following conditions in the Overall Risk Assessment:

- a. OPDP finds the proposed proprietary name misleading from a promotional perspective, and the Review Division concurs with OPDP's findings. The Federal Food, Drug, and Cosmetic Act provides that labeling or advertising can misbrand a product if misleading representations are made or suggested by statement, word, design, device, or any combination thereof, whether through a PROPRIETARY name or otherwise [21 U.S.C 321(n); See also 21 U.S.C. 352(a) & (n)].
- b. DMEPA identifies that the proposed proprietary name is misleading because of similarity in spelling or pronunciation to another proprietary or established name of a different drug or ingredient [CFR 201.10.(C)(5)].

- c. FMEA identifies the potential for confusion between the proposed proprietary name and other proprietary or established drug name(s), and demonstrates that medication errors are likely to result from the drug name confusion under the conditions of usual clinical practice.
- d. The proposed proprietary name contains an USAN (United States Adopted Names) stem.
- e. DMEPA identifies a potential source of medication error within the proposed proprietary name. For example, the proprietary name may be misleading or, inadvertently, introduce ambiguity and confusion that leads to errors. Such errors may not necessarily involve confusion between the proposed drug and another drug product but involve a naming characteristic that when incorporated into a proprietary name, may be confusing, misleading, cause or contribute to medication errors.

If DMEPA objects to a proposed proprietary name on the basis that drug name confusion could lead to medication errors, the primary Safety Evaluator uses the FMEA process to identify strategies to reduce the risk of medication errors. DMEPA generally recommends that the Sponsor select an alternative proprietary name and submit the alternate name to the Agency for review. However, in rare instances FMEA may identify plausible strategies that could reduce the risk of medication error of the currently proposed name. In that instance, DMEPA may be able to provide the Sponsor with recommendations that reduce or eliminate the potential for error and, thereby, would render the proposed name acceptable.

In the event that DMEPA objects to the use of the proposed proprietary name, based upon the potential for confusion with another proposed (but not yet approved) proprietary name, DMEPA will provide a contingency objection based on the date of approval. Whichever product, the Agency approves first has the right to use the proprietary name, while DMEPA will recommend that the second product to reach approval seek an alternative name.

The threshold set for objection to the proposed proprietary name may seem low to the Applicant/Sponsor. However, the safety concerns set forth in criteria a through e above are supported either by FDA regulation or by external healthcare authorities, including the Institute of Medicine (IOM), World Health Organization (WHO), the Joint Commission, and the Institute for Safe Medication Practices (ISMP). These organizations have examined medication errors resulting from look- or sound-alike drug names, confusing, or misleading names and called for regulatory authorities to address the issue prior to approval. Additionally, DMEPA contends that the threshold set for the Proprietary Name Risk Assessment is reasonable because proprietary drug name confusion is a predictable and preventable source of medication error that, in many instances, the Agency and/or Sponsor can identify and rectify prior to approval to avoid patient harm.

Furthermore, post-marketing experience has demonstrated that medication errors resulting from drug name confusion are notoriously difficult to rectify post-approval. Educational and other post-approval efforts are low-leverage strategies that have had limited effectiveness at alleviating medication errors involving drug name confusion. Sponsors have undertaken higher-leverage strategies, such as drug name changes, in the past but at great financial cost to the Sponsor and at the expense of the public welfare, not to mention the Agency's credibility as the authority responsible for approving the errorprone proprietary name. Moreover, even after Sponsors' have changed a product's proprietary name in the post-approval phase, it is difficult to eradicate the original proprietary name from practitioners' vocabulary, and as a result, the Agency has continued to receive reports of drug name confusion long after a name change in some instances. Therefore, DMEPA believes that post-approval efforts at reducing name confusion errors should be reserved for those cases in which the potential for name confusion could not be predicted prior to approval.

Appendix D:	Proprietary names not likely to be confused or not used in usual practice
settings for th	ne reasons described.

No.	Proprietary Name	Active Ingredient	Similarity to Zerbaxa	Failure preventions
1	Zubsolv	Buprenorphine hydrochloride and naloxone hydrochloride	Look	The pair has sufficient orthographic differences
2	Cetraxal	Ciprofloxacin hydrochloride	Look	The pair has sufficient orthographic differences
3	Verdeso	Desonide	Look	The pair has sufficient orthographic differences
4	Forfivo	Bupropion hydrochloride	Look	The pair has sufficient orthographic differences
5	Zelapar	Selegiline hydrochloride	Look	The pair has sufficient orthographic differences
6	Zetia	Ezetimibe	Look	The pair has sufficient orthographic differences
7	Zithromax	Azithromycin	Look and sound	The pair has sufficient orthographic and phonetic differences
8	Unasyn	Ampicillin sodium and sulbactam sodium	Look	The pair has sufficient orthographic differences
9	Zosyn	Piperacillin sodium and tazobactam sodium	Look	The pair has sufficient orthographic differences
10	Bactrim	Sulfamethoxazole and trimethoprim	Sound	The pair has sufficient phonetic differences
11	Cervarix	Human papillomavirus recombinant vaccine bivalent (Types 16, 18)	Sound	The pair has sufficient phonetic differences
12	Serpasil	Reserpine	Sound	The pair has sufficient phonetic differences
13	Zavesca	Miglustat	Sound	The pair has sufficient phonetic differences
14	Paxil	Paroxetine hydrochloride	Sound	The pair has sufficient phonetic differences

No.	Proprietary Name	Active Ingredient	Similarity to Zerbaxa	Failure preventions
15	Zirgan	Ganciclovir	Look and sound	The pair has sufficient orthographic and phonetic differences
16	Cymbalta	Duloxetine hydrochloride	Look and sound	The pair has sufficient orthographic and phonetic differences
17	Suboxone	Buprenorphine hydrochloride and naloxone hydrochloride	Look and sound	The pair has sufficient orthographic and phonetic differences
18	Zovirax	Acyclovir sodium	Look and sound	The pair has sufficient orthographic and phonetic differences
19	Abraxane	Paclitaxel protein-bound	Look and sound	The pair has sufficient orthographic and phonetic differences
20	Robaxin	Methocarbamol	Look and sound	The pair has sufficient orthographic and phonetic differences

<u>Appendix E:</u> Risk of medication errors due to product confusion minimized by dissimilarity of the names and/ or use in clinical practice for the reasons described.

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
1	Zetonna (Ciclesonide) Dosage form and Strength(s): Nasal aerosol solution: 37 mcg Usual dose: One spray in each nostril once daily.	Orthographic similarities: Both names are the same length and start with the prefix 'Ze'. Product characteristics similarities: Strength: single strength	Orthographic differences: Zetonna has an upstroke letter in the 3 rd position ('t') and Zerbaxa has an upstroke letter in the 4 th position ('b') that looks orthographically different when scripted. Zerbaxa has an 'r' in the 3 rd position. And the ending 'onna' in Zetonna is longer in length and looks orthographically different vs. the ending 'axa' in Zerbaxa. Product characteristics differences: Dose: the doses do not overlap
2	Surbex (Ascorbic acid 450 mg, cyanocobalamin 9 mcg, niacin 90.7 mg, pantothenic acid 16.6 mg, pyridoxine 3.7 mg, riboflavin 9 mg, sodium 65 mg, and thiamine 12.4 mg) Dosage form: Oral tablet Usual dose: Take one tablet by mouth once daily.	Orthographic similarities: Both names have a similar shape with the same upstroke letter in the 4 ^{th position} ('b'). The prefix 'Sur' in Surbex looks orthographically similar to the prefix 'Zer' in Zerbaxa when scripted. Product characteristics similarities: Strength: single strength	Orthographic differences: The ending 'ex' in Surbex looks orthographically different vs. the ending 'axa' in Zerbaxa. Product characteristics differences: Dose: the doses do not overlap

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
3	Zebeta (Bisoprolol fumarate) Dosage form and Strength(s): Oral tablet: 5 mg and 10 mg Usual dose: 5 to 20 mg by mouth once daily.	Orthographic similarities: Both names start with the prefix 'Ze'. Both names have the upstroke letter 'b' that looks orthographically similar when scripted (3 rd position vs. 4 th position). The cross stroke 't' in Zebeta can look like an 'x' when scripted, therefore, the ending 'eta' in Zebeta looks orthographically similar to the ending 'axa' in Zerbaxa when scripted.	Orthographic differences: Zerbaxa has an extra letter 'r' in its infix that is not present in Zebeta. Product characteristics differences: Strength: bisoprolol fumarate 5 mg and 10 mg vs. ceftolozane/tazobactam 1.5 g or expressed as a single strength product with no strength noted. Dose: the doses do not overlap
4	Zorbtive (Somatropin lyophilisate) Dosage form and Strength: Powder for injection: 8.8 mg Usual dose: 0.1 mg/kg subcutaneously once daily for 4 weeks (for a 70 kg patient, the dose is 7 mg).	Orthographic similarities: The prefix 'Zorb' in Zorbtive looks orthographically similar to the prefix 'Zer' in Zerbaxa when scripted. Product characteristics similarities: Strength: single strength	Orthographic differences: The ending 'tive' in Zorbtive looks orthographically different vs. the ending 'axa' in Zerbaxa. Product characteristics differences: Dose: the doses do not overlap

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
5	Cerebyx (Fosphenytoin sodium) Dosage form and Strength(s): Solution for injection: 100 mg PE/2 mL and 500 mg PE/10 mL Usual dose: The initial dose is 4 to 6 mg PE/kg/day intravenously or intramuscularly, divided into 2 or more doses.	Orthographic similarities: The prefix 'Cer' in Cerebyx looks orthographically similar to the prefix 'Zer' in Zerbaxa when scripted. Product characteristics similarities: Strength: Both can be expressed as a single strength product with no strength noted.	Orthographic differences: The infix 'eb' in Cerebyx looks orthographically different vs. the infix 'b' in Zerbaxa. The ending 'yx' in Cerebyx looks orthographically different vs. the ending 'axa' in Zerbaxa. Product characteristics differences: Dose: the doses do not overlap
6	Zolinza (Vorinostat) Dosage form and Strength(s): Oral capsule: 100 mg Usual dose: 400 mg by mouth once daily with food until progressive disease or unacceptable toxicity.	 Orthographic similarities: Both names are the same length. The prefix 'Zo' in Zolinza looks orthographically similar to the prefix 'Ze' in Zerbaxa when scripted. Product characteristics similarities: Strength: single strength 	Orthographic differences: Zolinza has an upstroke letter in the 3 rd position ('1') and Zerbaxa has an upstroke letter in the 4 th position ('b') that looks orthographically different when scripted. Zerbaxa has an 'r' in the 3 rd position. And the ending 'inza' in Zolinza looks orthographically different vs. the ending 'axa' in Zerbaxa. Product characteristics differences: Dose: the doses do not overlap

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
7	Pradaxa (Dabigatran) Dosage form and Strength(s): Oral capsule: 75 mg and 150 mg Usual dose: 150 mg by mouth twice daily.	 Orthographic similarities: Both names have a similar shape and are the same length (7 letters). Both names have an upstroke letter in the 4th position ('d' vs. 'b') that looks orthographically similar when scripted. And both names have the same ending 'axa'. Phonetic similarities: Both names contain 3 syllables. The third syllable of both names is the same ('axa'). 	Orthographic differences: The prefix 'Pra' in Pradaxa looks orthographically different vs. the prefix 'Zer' in Zerbaxa. Phonetic differences: The first and second syllables in both names give the names a distinctly different sound when spoken ('pra' vs. 'zer' and 'da' vs. 'ba'). Product characteristics differences: Strength: dabigatran 75 mg and 150 mg vs. ceftolozane/tazobactam 1.5 g or expressed as a single strength product with no strength noted. Dose: the doses do not overlap

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
8	Zyprexa	Orthographic similarities:	Orthographic differences:
	(Olanzapine)	Both names start with the letter	The shape of both names is
	Dosage form and Strength(s):	'Z' and have the same ending	different. And the infix of both
	Oral disintegrating tablet: 5 mg, 10 mg, 15 mg, and 20 mg	Δα .	different when scripted ('ypre' vs. 'erba')
	Oral tablet: 2.5 mg, 5 mg, 7.5 mg,	Phonetic similarities:	
	10 mg, 15 mg, and 20 mg	Both names contain 3 syllables.	Phonetic differences:
	Intramuscular powder for injection: 10 mg	is the same ('xa').	The first and second syllables in both names give the names a
	Extended-release powder for injection: 210 mg, 300 mg, and 405 mg	Product characteristics similarities:	distinctly different sound when spoken ('zy' vs. 'zer' and 'pre' vs. 'ba').
	Usual dose:	Strength: Both can be expressed	
	Oral: 5 to 20 mg by mouth once as no	as a single strength product with no strength noted.	Product characteristics differences:
	Intramuscular: 10 mg intramuscularly as a single dose		Dose: the doses do not overlap
	Extended-release: 210 to 300 mg intramuscularly every 2 weeks or 405 mg intramuscularly every 4 weeks.		

Causes (could be multiple)	factors, are expected to minimize the risk of confusion between these two names
Orthographic similarities: Both names are the same length (7 letters) and have the same beginning 'Zer'. Phonetic similarities: Both names contain 3 syllables. The first syllable of both names is the same ('zer'). Product characteristics similarities: Strength: single strength	Orthographic differences: The shape of both names is different. And the ending of both names look orthographically different when scripted ('valx' vs. 'baxa') Phonetic differences: The second and third syllables in both names give the names a distinctly different sound when spoken ('val' vs. 'ba' and 'x' vs. 'xa'). Product characteristics differences:
O B (7 b b e P I B (7 F I B (7 F I B) (7 F I B) (7 F I B) (7 F I B) (7 F I S) (7 F) (7) (7) (7) (7) (7) (7) (7) (7) (7) (7	auses (could be multiple) rthographic similarities: oth names are the same length letters) and have the same eginning 'Zer'. honetic similarities: oth names contain 3 syllables. he first syllable of both names the same ('zer'). roduct characteristics milarities: rength: single strength

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
10	Celexa (Citalopram) Dosage form and Strength(s): Oral solution: 10 mg/5 mL Oral tablet: 10 mg, 20 mg, and 40 mg Usual dose: 20 to 40 mg by mouth once daily.	Orthographic similarities: The prefix 'Ce' in Celexa looks orthographically similar to the prefix 'Ze' in Zerbaxa when scripted. And the ending 'exa' in Celexa looks orthographically similar to the ending 'axa' in Zerbaxa when scripted Phonetic similarities: Both names contain 3 syllables. The third syllable of both names is the same ('xa').	Orthographic differences: The infix '1' in Celexa looks orthographically different vs. the infix 'rb' Zerbaxa. Phonetic differences: The first and second syllables in both names give the names a distinctly different sound when spoken ('ce' vs. 'zer' and 'le' vs. 'ba'). Product characteristics differences: Strength: citalopram 10 mg/5 mL, 10 mg, 20 mg, and 40 mg vs. ceftolozane/tazobactam 1.5 g or expressed as a single strength product with no strength noted. Dose: the doses do not overlap

	Proposed name: Zerbaxa (Ceftolozane/tazobactam) Dosage form and Strength: Powder for injection: 1.5 g Usual dose: 1.5 g intravenously every 8 hours	Failure Mode: Incorrect Product Ordered/ Selected/Dispensed or Administered because of Name confusion Causes (could be multiple)	Prevention of Failure Mode In the conditions outlined below, the following combination of factors, are expected to minimize the risk of confusion between these two names
11	Fentora (Fentanyl citrate) Dosage form and Strength(s): Buccal tablet: 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg Usual dose: Initial dose for breakthrough pain is 100 mcg placed above a rear molar between the upper cheek and gum. During an episode of breakthrough pain, one additional dose of the same strength, if needed, may be taken 30 minutes after the start of the previous administration.	Orthographic similarities: The prefix 'Fen' in Fentora looks orthographically similar to the prefix 'Zer' in Zerbaxa when scripted. Both names have an upstroke letter in the 4 th position ('t' vs. 'b') that looks orthographically similar when scripted. And the ending 'ora' in Fentora looks orthographically similar to the ending 'axa' in Zerbaxa when scripted.	Orthographic differences: If scripted in lower case, the first letter 'f' in Fentora looks orthographically different vs. the first letter 'z' in Zerbaxa. Product characteristics differences: Strength: fentanyl citrate 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, and 800 mcg vs. ceftolozane/tazobactam 1.5 g or expressed as a single strength product with no strength noted. Dose: the doses do not overlap
