K981467

JUN 22 1998

510(k) Summary

Submitter's Name/Address
Abbott Laboratories
1920 Hurd Drive
Irving, Texas 75038

Contact Person
Mark Littlefield
Section Manager MS 1-8
Regulatory Affairs
(972) 518-7861
Fax (972) 753-3367

Date of Preparation of this Summary: April 22, 1998

Device Trade or Proprietary Name: Amm

Device Common/Usual Name or Classification Name: Ammonia

Classification Number/Class: 75JIX/Class I

This summary of 510(k) safety and effectiveness information is being submitted in accordance with the requirements of SMDA 1990 and 21 CFR 807.92.

The assigned 510(k) number is: _____.

Test Description:

Ammonia is an *in vitro* diagnostic assay for the quantitative determination of ammonia in human plasma. The Ammonia assay is a clinical chemistry assay which utilizes the amination of α–ketoglutarate by ammonia (NH_3) along with the concomitant oxidation of NH_xDPH. These reactions, catalyzed by glutamate dehydrogenase (GLDH), produce glutamate and NH_xDP^+. The oxidation of NH_xDPH produces a decrease in absorbance at 340 nm which is directly proportional to the concentration of ammonia in the sample.

Substantial Equivalence:

The Ammonia assay is substantially equivalent to the Roche® Cobas Mira® Plus Automated Chemistry System Ammonia assay (K914750).

Both assays yield similar Performance Characteristics.

Similarities:

- Both assays are *in vitro* clinical chemistry methods.
- Both assays can be used for the quantitative determination of ammonia.
- Both assays yield similar clinical results.

Differences:

- There is a minor difference between assay range.

Intended Use:

The Ammonia assay is used for the quantitation of ammonia in human plasma.

Performance Characteristics:

Comparative performance studies were conducted using the ALCYON™ Analyzer. The Ammonia assay method comparison yielded acceptable correlation with the Roche Cobas Mira Plus Automated Chemistry System Ammonia assay. The correlation coefficient = 0.9969, slope = 1.044, and Y-intercept = 12.020 µmol/L. Precision studies were conducted using the Ammonia assay. Within-run, between-run, and between-day studies were performed using three levels of control material. The total %CV for Level 1/Panel 121 is 13.8%, 5.2% for Level 2/Panel 122, and 3.0% for Level 3/Panel 123. The Ammonia assay is linear up to 630 µmol/L. The limit of quantitation (sensitivity) of the Ammonia assay is 19 µmol/L. These data demonstrate that the performance of the Ammonia assay is substantially equivalent to the performance of the Roche Cobas Mira Plus Automated Chemistry System Ammonia assay.

Conclusion:

The Ammonia assay is substantially equivalent to the Roche Cobas Mira Plus Automated Chemistry System Ammonia assay as demonstrated by results obtained in the studies.

Re: K981467
AMM
Regulatory Class: I
Product Code: JIF
Dated: April 22, 1998
Received: April 23, 1998

Dear Mr. Littlefield:

We have reviewed your Section 510(k) notification of intent to market the device referenced above and we have determined the device is substantially equivalent (for the indications for use stated in the enclosure) to devices marketed in interstate commerce prior to May 28, 1976, the enactment date of the Medical Device Amendments, or to devices that have been reclassified in accordance with the provisions of the Federal Food, Drug, and Cosmetic Act (Act). You may, therefore, market the device, subject to the general controls provisions of the Act. The general controls provisions of the Act include requirements for annual registration, listing of devices, good manufacturing practice, labeling, and prohibitions against misbranding and adulteration.

If your device is classified (see above) into either class II (Special Controls) or class III (Premarket Approval), it may be subject to such additional controls. Existing major regulations affecting your device can be found in the Code of Federal Regulations, Title 21, Parts 800 to 895. A substantially equivalent determination assumes compliance with the Current Good Manufacturing Practice requirements, as set forth in the Quality System Regulation (QS) for Medical Devices: General regulation (21 CFR Part 820) and that, through periodic QS inspections, the Food and Drug Administration (FDA) will verify such assumptions. Failure to comply with the GMP regulation may result in regulatory action. In addition, FDA may publish further announcements concerning your device in the Federal Register. Please note: this response to your premarket notification submission does not affect any obligation you might have under sections 531 through 542 of the Act for devices under the Electronic Product Radiation Control provisions, or other Federal laws or regulations.

Under the Clinical Laboratory Improvement Amendments of 1988 (CLIA-88), this device may require a CLIA complexity categorization. To determine if it does, you should contact the Centers for Disease Control and Prevention (CDC) at (770) 488-7655.

This letter will allow you to begin marketing your device as described in your 510(k) premarket notification. The FDA finding of substantial equivalence of your device to a legally marketed predicate device results in a classification for your device and thus, permits your device to proceed to the market.

If you desire specific advice for your device on our labeling regulation (21 CFR Part 801 and additionally 809.10 for in vitro diagnostic devices), please contact the Office of Compliance at (301) 594-4588. Additionally, for questions on the promotion and advertising of your device, please contact the Office of Compliance at (301) 594-4639. Also, please note the regulation entitled, "Misbranding by reference to premarket notification" (21 CFR 807.97). Other general information on your responsibilities under the Act may be obtained from the Division of Small Manufacturers Assistance at its toll-free number (800) 638-2041 or (301) 443-6597 or at its internet address "http://www.fda.gov/cdrh/dsmamain.html".

Sincerely yours,

Steven Gutman

510(k) Number (if known): _____

Device Name: Ammonia

Indications For Use:

The Ammonia assay is used for the quantitation of ammonia in human plasma. Ammonia measurements are used in the diagnosis and treatment of severe liver disorders, such as cirrhosis, hepatitis, and Reye's syndrome.
