# CENTER FOR DRUG EVALUATION AND RESEARCH

APPLICATION NUMBER: 40287

## DRAFT FINAL PRINTED LABELING

#### PREDNISOLONE SYRUP, USP 15 mg/5mL

#### DESCRIPTION

DESCRIPTION
Prednisolone Syrup contains Prednisolone, which is a glucocorticoid. Glucocorticoids are adrenocortical steroids, both naturally occurring and synthetic, which are readily absorbed from the gastrointestinal tract. Prednisolone is a white to practically white, odoriess crystalline powder. It is very slightly soluble in water, slightly soluble in alcohol, in chloroform, in dioxane, and in methanol.

The chemical name for Prednisolone is: 11 $\beta$ , 17, 21-Tritydroxypregna-1, 4-diene-3, 20-dione (anhydrous). Its molecular weight is 360.45. The molecular formula is  $C_{21}H_{28}O_{5}$ , and the structural formula is:

Prednisolone Syrup contains 15 mg of Prednisolone in each 5 mL. It also contains as inactive ingredients: Alcohol, Benzoic Acid, Caramet Color, Citric Acid, Disodium Edetate, FD&C Red #40, Flavors, Glycerin, Propylene Glycol, Punified Water, Sodium Saccharin, & Sucrose.

#### CLINICAL PHARMACOLOGY

CLINICAL PHARMACULOGY

Naturally occurring glucocorticoids (hydrocortisone and cortisone), which also have salt-retaining properties are used as replacement therapy in adrenocortical deficiency states. Their synthetic analogs such as Prednisolone are primarily used for their potent anti-inflammatory effects in disorders of many organ

a parameter of the properties of the properti

#### INDICATIONS AND USAGE

Prednisolone Syrup is indicated in the following conditions:

#### 1. Endocrine Disorders

Engerine Disagrems
Primary or secondary adrenocortical insufficiency (hydrocortisone or cortisone is the first choice: synthetic analogs may be used in conjunctions with mineralocorticoids where applicable; in infancy mineralocorticoid supplementation is of particular importance.)

Congenital adrenal hyperplasia

Nonsuppurative thyroiditis

Hypercalcemia associated with cancer

#### 2. Rheumatic Disorders

As adjunctive therapy for short-term administration (to tide the patient over an acute episode or

reconstruction of the state of

dose maintenance therapy) Ankylosing spondylitis

Acute and subacute bursitis

Acute nonspecific tenosynovitis

Acute gouty arthritis Post-traumatic osteoarthritis

Synovitis of osteroarthritis

**Epicondylitis** 

#### 3. Collagen Diseases

During an exacerbation or as maintenance therapy in selected cases of: Systemic lupus erythematosus

Acute rheumatic carditis

### 4. Dermatologic Diseases

Pemphigus Bullous dermatitis herpetitormis

Severe erythema multiforme (Stevens-Johnson syndrome) Exfoliative dermatitis

Mycosis fungoides

Severe psoriasis

Severe seborrheic dermatitis

#### 5. Allergic States

REPORTED ASSESSED.

Control of severe or incapacitating allergic conditions intractable to adequate trials of conventional

Seasonal or perennial allergic rhinitis

Bronchial asthma Contact dermatitis

Atopic dermatitis

Servin sickness Drug hypersensitivity reactions

#### 6. Ophthalmic Diseases

e and chronic allergic inflammatory processes involving the eye and its adnexa such as: acute and chronic allergic inflammatory
 Allergic corneal marginal utders
 Herpes zoster ophthalmicus
 Anterior segment inflammation
 Diffuse posterior uveitis and choroiditis
 Sympathetic ophthalmia
 Allergic posterior discontinuority

Jan Jan

Allergic conjunctivitis

Keratitis

Chorioretinitis

fritis and iridocyclitis

#### 7. Respiratory Diseases

Symptomatic sarcoidosis
Loeffler's syndrome not manageable by other means

perymouss Fulminating or disseminated pulmonary tuberculosis when used concurrently with appropriate chemotherapy Aspiration pneumonitis

#### 8. Hematologic Disorders

Tennaviore: Discriment diopathic thrombocytopenic purpura in adults Secondary thrombocytopenia in adults Acquired (autoimmune) hemolytic anemia Erythroblastopenia (RBC anemia) Congenital (erythroid) hypoplastic anemia

## 9. <u>Neoplastic Diseases</u>

Reoplastic Utseases
For palliative management of:
Leukemias and lymphomas in adults
Acute leukemia of childhood

#### 10. Edematous States

To induce a diuresis or remission of proteinuria in the nephrotics syndrome, without uremia, of the

idiopathic type or that due to lupus erythematosus. 11. Gastrointestinal Diseases

To tide the patient over a critical period of the disease in:

Ulcerative colitis

Regional enteritis

#### 12. Miscellaneous

• <u>Masketonicums</u>
Tuberculous meningitis with subarachnoid block or impending block used concurrently with appropriate antituberculous chemotherapy. Trichinosis with neurologic or myocardial involvement.

In addition to the above indications Prednisolone Syrup is indicated for systemic dermatomyositis

#### CONTRAINDICATIONS

## Systemic fungal infections.

#### WARNINGS

In patients on corticosteroid therapy subjected to unusual stress, increased dosage of rapidly acting corticosteroids before, during and after the stressful situation is indicated.

Corticosteroids may mask some signs of infection, and new infections may appear during their use. There may be decreased resistance and inability to localize infection when corticosteroids are used.

Prolonged use of corticosteroids may produce posterior subcapsular cataracts, glaucoma with possible damage to the optic nerves, and may enhance the establishment of secondary ocular infections due to

Average and large doses of hydrocortisone or cortisone can cause elevation of blood pressure, salt and water retention, and increased excretion of potassium. These effects are less likely to occur with synthetic derivatives except when used in large doses. Dietary salt restrictions and potassium supplementation may be necessary. All corticosteroids increase calcium excretion.

While on corticosteroids therapy, patients should not be vaccinated against smallpox. Other immunization procedures should not be undertaken in patients who are on corticosteroids, especially on high dose, because of possible hazards of neurological complications and a lack of antibody

Persons who are on drugs which suppress the immune system are more susceptible to infections than healthy individuals. Chickenpox and measles, for example, can have a more serious or even fatal course in non-immune children or adults on corticosteroids. In such children or adults who have not had these diseases, particular care should be taken to avoid exposure. How the dose, route and duration of corticosteroid administration affects the risk of developing a disseminated infection is not known. The contribution of the underlying disease and/or prior corticosteroid treatment to the risk is also not known. If exposed to chickenpox, prophytaxis with varicella zoster immune globulin (IVIG) may be indicated. If exposed to measles, prophytaxis with pooled intravenous immunoglobulin (IVIG) may be indicated (See the respective package inserts for complete VZIG and IVIG prescribing information.) If

MAY 28 1999

chicke. A develops, treatment with antiviral agents may be considered.

The use of Prechisolonic Syrup in active tuberculosis should be restricted to those cases of fulminating the portion terroid is used for the management of the disease or disseminated tuberculosis in which the corticosteroid is used for the management of the disease in conjunction with an appropriate antituberculous regimen.

If corticosteroids are indicated in patients with latent tuberculosis or tuberculin reactivity, close observation is necessary as reactivation of the disease may occur. During prolonged corticosteroid therapy, these patients should receive chemoprophylaxis

Use in pregnancy: Since adequate human reproduction studies have not been done with corticosteroids, the use of these drugs in pregnancies, nursing mothers or women of childbearing potential requires that the possible benefits of the drug be weighed against the potential hazards to the mother and embryo or fetus. Infants born of mothers who have received substantial doses of corticosteroids during pregnancy should be carefully observed for signs of hypoadrenalism.

#### GENERAL

Drug-induced secondary adrenocortical insufficiency may be minimized by gradual reduction of dosage. This type of relative insufficiency may persist for months after discontinuation of therapy; therefore, in any situation of stress occurring during that period, hormone therapy should be reinstituted. Since mineral-ocorticoid secretion may be impaired, salt and/or a mineral-ocorticoid should be administered concurrently.

There is an enhanced effect of corticosteroids on patients with hypothyroidism and in those with cirrhosis.

Corticosteroids should be used cautiously in patients with ocular herpes simplex because of possible corneal perforation.

The lowest possible dose of corticosteroid should be used to control the condition under treatment, and when reduction in dosage is possible, the reduction should be gradual.

Psychic derangements may appear when corticosteroids are used, ranging from euphoria, insomnia, mood swings, personality changes and severe depression, to frank psychotic manifestations. Also, existing emotional instability or psychotic tendencies may be aggravated by corticosteroids.

Aspirin should be used cautiously in conjunction with corticosteroids in hypoprothrombinemia

Steroids should be used with caution in nonspecific Ulcerative Colitis, if there is a probability of impending perforation, abscess or other pyogenic infections: diverticulitis; fresh intestinal anastomoses, active or latent peptic ulcer; renal insufficiency, hypertension; osteoporosis; and myasthenia gravis.

Growth and development of infants and children on prolonged corticosteroid therapy should be carefully inharmed.

Information for patients: Patients who are on immunosuppressant doses of corticosteroids should be warned to avoid exposure to chickenpox or measles. Patients should also be advised that if they are exposed, medical advice should be sought without delay.

#### **ADVERSE REACTION**

## Fluid and Electrolyte Disturbances Sodium retention

Fluid retention

Congestive heart failure in susceptible patients

Potassium loss Hypokalemia alkalosis

Hypertension

Muscle weakness

Loss of muscle mass

Osteonorosis Vertebral compression fractures

Aseptic necrosis of femoral and humeral heads

Pathologic fracture of long bones

Peptic ulcer with possible perforation and hemorrhage **Pancreatitis** 

Abdominal distention

Ulcerative esophagitis

#### Dermatologic

Impaired wound healing Thin fragile skin Petechiae and ecchymoses

Facial erythema

Increased sweating

May suppress reactions to skin test

#### ological

Increased intracranial pressure with papilledema (pseudo-tumor cerbri) usually after treatment

Vertigo

#### Headache

#### Menstrual irregularities

Development of Cushingoid state

Suppression of growth in children

Secondary adrencortical and pituitary unresponsiveness, particularly in times of stress, as in

trauma, surgery or illness Decreased carbohydrate tolerance

Manifestations of latent diabetes mellitus

Increased requirements for insulin or oral hypoglycemic agents in diabetics

Posterior subcapsular cataracts

Increased intraocular pressure

Exophthalmos

### Negative nitrogen balance due to protein catabolism

#### DOSAGE and ADMINISTRATION

Dosage of Prednisolone Syrup should be individualized according to the severity of the disease and the response of the patient. For infants and children, the recommended dosage should be governed by the same considerations rather than strict adherence to the ratio indicated by age or body w

Hormone therapy is an adjunct to and not a replacement for conventional therapy

Dosage should be decreased or discontinued gradually when the drug has been administered for more

The severity, prognosis, expected duration of the disease and the reaction of the patient to medication are primary factors in determining dosage.

If a period of spontaneous remission occurs in a chronic condition, treatment should be discontinued.

Blood pressure, body weight, routine laboratory studies, including two-hour postprandial blood glucose and serum potassium, and a chest X-ray should be obtained at regular intervals during prolonged therapy. Upper GI X-rays are desirable in patients with known or suspected peptic ulcer disease.

The initial dosage of prednisolone Syrup may vary from 5 mg to 60 mg per day depending on the specific disease entity being treated. In situations of less seventy lower doses will generally suffice, while in selected patients higher initial doses may be required. The initial dosage should be maintained or adjusted until a satisfactory response is noted. If after a reasonable period of time there is a lack of satisfactory clinical response. Prednisolone Syrup should be discontinued and the patient transferred to other appropriated therapy. IT SHOULD BE EMPHASIZED THAT DOSAGE REQUIREMENTS ARE VARIABLE AND MUST BE INDIVIDUALIZED ON THE BASIS OF THE DISEASE UNDER TREATMENT AND THE RESPONSE OF THE

After a favorable response is noted, the proper maintenance dosage should be determined by decreasing the rate is avoidable response is noted, the proper maniferance dusage anounce of determined by decreasing one initial drug dosage in small decrements at appropriate time intervals until the lowest dosage which will maintain an adequate clinical response is reached. It should be kept in mind that constant monitoring is needed in regard to drug dosage. Included in the situations which may make adjustments necessary are changes in clinical status secondary to remissions or exacerbations in the disease process, the patient's individual drug responsiveness and the effect of patient exposure to stressful situations not directly related to the disease entity under treatment. In this latter situation it may be necessary to increase the dosage of Prednisolone Syrup for a period of time consistent with the patients condition. If after long-term therapy the drug is to be stopped, it is recommended that it be withdrawn gradually rather than abruptly

#### HOW SUPPLIED

Prednisolone Syrup is a red colored, cherry flavored liquid containing 15 mg of Prednisolone in each 5 mL (teaspoonful) and is supplied in 8 oz. (236 mL) and 16 oz. (473 mL) bottles.

Pharmacist: Dispense with a suitable calibrated measuring device to assure proper measuring of dose.
