3 ML DISPOSABLE INSULIN DELIVERY DEVICE
HUMULIN® 70/30 Pen
70% HUMAN INSULIN
ISOPHANE SUSPENSION
AND
30% HUMAN INSULIN INJECTION
(dDNA ORIGIN)

WARNINGS

THIS LILLY HUMAN INSULIN PRODUCT DIFFERS FROM
ANIMAL-SOURCE INSULINS BECAUSE IT IS STRUCTURALLY
IDENTICAL TO THE INSULIN PRODUCED BY YOUR BODY'S
PANCREAS AND BECAUSE OF ITS UNIQUE MANUFACTURING
PROCESS.

NEVER CHANGE OF INSULIN SHOULD BE MADE CAUTIOUSLY
AND ONLY UNDER MEDICAL SUPERVISION. CHANGES IN
STRENGTH, MANUFACTURER, TYPE (E.G., REGULAR, NPH,
LIQUAMETER, ETC) SPECIES (BEEF, PORK, BEEF-PORK, HUMAN), OR
METHOD OF MANUFACTURE (dDNA VERSUS ANIMAL-SOURCE
INSULIN) MAY RESULT IN THE NEED FOR A CHANGE IN DOSAGE.
SOME PATIENTS TAKING HUMULIN® HUMAN INSULIN, dDNA ORIGIN
MAY REQUIRE A CHANGE IN DOSAGE FROM THAT
USED WITH ANIMAL-SOURCE INSULINS. IF AN ADJUSTMENT IS
NEEDED, IT MAY OCCUR WITH THE FIRST DOSE OR DURING
THE FIRST SEVERAL WEEKS OR MONTHS.

TO OBTAIN AN ACCURATE DOSE, CAREFULLY READ AND
FOLLOW THE "DISPOSABLE INSULIN DELIVERY DEVICE USER
MANUAL" AND THIS INFORMATION FOR THE PATIENT INSERT
BEFORE USING THIS PRODUCT. (SEE ALSO INSTRUCTIONS FOR
PEN USE SECTION.)

DIABETES

Insulin is a hormone produced by the pancreas, a large gland that lies
near the stomach. The hormone is necessary for the body's correct use of
food, especially sugar. Diabetes occurs when the pancreas does not
make enough insulin to meet your body's needs.

To control your diabetes, your doctor has prescribed injections of
insulin products to keep your blood glucose at a near-normal level. You
have been instructed to feed your blood and/or your urine regularly for
Glucose. Studies have shown that chronic complications of diabetics such as eye disease, kidney disease, and nerve disease can be significantly reduced if the blood sugar is maintained as close to normal as possible. The American Diabetes Association recommends that your period glucose levels are consistently above 140 mg/dL or if the hemoglobin A1c (HbA1c) is more than 5.5, consult your doctor. A change in your diabetes therapy may be needed. If your blood tests consistently show below-normal glucose levels, you should also let your doctor know. Proper control of your diabetes requires close and constant coordination with your doctor. Despite diabetes, you can lead an active and healthy life if you eat a balanced diet, exercise regularly, and take your insulin injections as prescribed.

Always keep an extra supply of insulin as well as a spare syringe and
needle on hand. Always wear diabetics identification so that appropriate
treatment can be given if complications occur away from home.

70/30 HUMAN INSULIN

Description
Humulin is synthesized in a non-disease-producing special laboratory
strain of Escherichia coli bacteria that has been genetically altered by
the addition of the human genes for insulin production. Humulin 70/30 is
a mixture of 70% Human Insulin/NPH Suspension and 30% Human
Insulin Injection. It is an intermediate-acting insulin combined with the
more rapid onset of action of regular insulin. The duration of activity may
last up to 24 hours following injection. The time course of action of any
insulin may vary considerably in different individuals or at different times
in the same individual. As with all insulin preparations, the duration of
action of Humulin 70/30 is dependent on dose, site of injection, blood
supply, temperature, and physical activity. Humulin 70/30 is a sterile
suspension and is for subcutaneous injection only. It should not be used
intravenously or intramuscularly. The concentration of Humulin 70/30 in
the Humulin 70/30 Pen is 100 units/mL (U-100).

Identification
Humulin disposable insulin delivery devices, manufactured by Eli Lilly
and Company, are available in 2 formulations—NPH and 70/30.

Your doctor has prescribed the type of insulin that he/she believes is best
for you. DO NOT USE ANY OTHER INSULIN EXCEPT ON HIGHER ADVICE AND DIRECTION.

Preventing the appearance of Humulin 70/30 suspension in the insulin pen before use, and if you note anything unusual in the appearance of Humulin 70/30 suspension or notice your insulin requirements changing markedly, consult your doctor.

Never attempt to remove the cartridge from the Humulin 70/30 Pen. Inspect the cartridge through the clear cartridge holder.

STORAGE
Humulin 70/30 Pen should be stored in a refrigerator but not in the
freezer. The Humulin 70/30 Pen that you are currently using should not
be refrozen but should be kept as cool as possible below 60°F (16°C) and
away from heat and light. Do not use an insulin pen if it has been
frozen. Unrefrigerated Humulin 70/30 Pen must be discarded after
10 days, even if it still contains insulin. Do not use Humulin 70/30 Pen after the expiration date stamped on the label.

INSTRUCTIONS FOR PEN USE

It is important to read, understand, and follow the instructions in the "Disposible Insulin Delivery Device User Manual" before using. Failure to follow instructions may result in an inaccurate insulin dose.

NEVER SHARE INSULIN PENS, CARTRIDGES, OR NEEDLES.

PREPARING THE PEN FOR INJECTION
1. Always check the appearance of the Humulin 70/30 suspension in the insulin pen before use.
2. Roll the Humulin 70/30 Pen between the palms 10 times (see Figure 1 above).
3. Holding the Humulin 70/30 Pen by one end, invert it 180° slowly 10 times to allow the glass head to travel the full length of the cartridge with each inversion (see Figure 2 above). The cartridge is contained in the clear cartridge holder of the Humulin 70/30 Pen.
4. Inspect the appearance of the Humulin 70/30 suspension to make sure the contents look uniformly cloudy or milky. If not, repeat the above steps until the contents are mixed. Do not use a Humulin 70/30 Pen if there are clumps in the insulin or if solid white particles stick to the walls of the cartridge.

5. Follow the instructions in the "Disposible Insulin Delivery Device User Manual" for these steps:
   - Preparing the Pen
   - Attaching the Needle
   - Priming the Pen (Checking the Insulin Flow)
   - Cleaning (Disassembling) a Does
   - Injecting the Dose
   - Following an Injection

PREPARING FOR INJECTION
1. Wash your hands.
2. To avoid tissue damage, choose a site for each injection that is at least 1 inch from the previous injection site. The usual sites of injection are abdomen, thighs, and arms.
3. Cleanse the skin with alcohol where the injection is to be made.
4. With one hand, stabilize the skin by spreading it or pinching up a large area.
5. Invert the dose as instructed by your doctor.
6. After dispensing a dose, pull the needle out and apply gentle pressure over the injection site for several seconds. Do not rub the area.
7. Immediately after an injection, remove the needle from the Humulin 70/30 Pen. Doing so will guard against contamination, leakage.
DOSEAGE

Your doctor has told you which insulin to use, how much, and when and how often to inject it. Because each patient's case of diabetes is different, this schedule has been individualized for you.

Your usual insulin dose may be affected by changes in your food, activity, or work schedule. Carefully follow your doctor's instructions to allow for these changes. Other things that may affect your insulin dose are:

- Illness
  - Illness, especially with nausea and vomiting, may cause your insulin requirements to change. Even if you are not eating you will still require insulin. You and your doctor should establish a sick day plan for you to use in case of illness. When you are sick, test your blood glucose/time glucose and ketones frequently and call your doctor as instructed.
- Pregnancy
  - Good control of diabetes is especially important for you and your unborn baby. Pregnancy may make managing your diabetes more difficult. If you are planning to have a baby, are pregnant, or are nursing a baby, consult your doctor.
- Medication
  - Insulin requirements may be increased if you are taking other drugs with hypoglycemic activity, such as oral contraceptives, corticosteroids, or thyroid replacement therapy. Insulin requirements may be reduced in the presence of drugs with hypoglycemic activity, such as oral hypoglycemics, salicylates (for example, aspirin), sulfa antibiotics, and certain antidepressants. Always discuss any medications you are taking with your doctor.
- Exercise
  - Exercise may lower your body's need for insulin during and for some time after the activity. Exercise may also speed up the effect of an insulin dose, especially if the exercise involves the area of injection site (for example, the leg should not be used for injection just prior to running). Discuss with your doctor how you should adjust your regimen to accommodate exercise.
- Travel
  - Persons traveling across more than two time zones should consult their doctor concerning adjustments in their insulin schedule.

COMMON PROBLEMS OF DIABETES

Hypoglycemia (Insulin Reaction)

Hypoglycemia (too little glucose in the blood) is one of the most frequent adverse events experienced by insulin users. It can be brought about by:

1. Taking too much insulin
2. Missing or delaying meals
3. Exercising or working more than usual
4. An infection or illness (especially with diarrhea or vomiting)
5. Taking too much insulin in the body's need for insulin
6. Diseases of the adrenal, pituitary or thyroid gland, or progression of kidney or liver disease
7. Interactions with other drugs that lower blood glucose, such as oral hypoglycemics, salicylates (for example, aspirin), sulfa antibiotics, and certain antidepressants
8. Consumption of alcoholic beverages

Symptoms of mild to moderate hypoglycemia may occur suddenly and can include:

- sweating
- dizziness
- palpitations
- tremor
- hunger
- restlessness
- tingling in the hands, feet, lips, or tongue
- light-headedness
- inability to concentrate
- headache

Signs of severe hypoglycemia can include:

- disorientation
- unconsciousness
- death

Therefore, it is important that assistance be obtained immediately.

Early warning symptoms of hypoglycemia may be different or less pronounced under certain conditions, such as long duration of diabetes, diabetic nerve disease, medications such as beta blockers, changes in insulin preparations, or intensified control (3 or more insulin injections per day) of diabetes.

A few patients who have experienced hypoglycemic reactions after transfer from animal-source insulin to human insulin have reported that the early warning symptoms of hypoglycemia were various types of symptoms that may indicate hypoglycemia. Patients should monitor their blood glucose frequently, especially prior to activities such as driving. If the blood glucose is below your normal fasting glucose, you should consider eating or drinking sugar-containing foods to treat your hypoglycemia.

Mild to moderate hypoglycemia may be treated by eating foods or drinks that contain sugar. Patients should always carry a quick source of sugar, such as candy, mints, or glucose tablets. More severe hypoglycemia may require the assistance of another person. Patients who are unable to take sugar orally or who are unconscious require an injection of glucagon or should be treated intravenously administration of glucose at a medical facility.

You should learn to recognize your own symptoms of hypoglycemia. If you are uncertain about these symptoms, you should monitor your blood glucose frequently to help you learn to recognize the symptoms that you experience with hypoglycemia.

If you have frequent episodes of hypoglycemia or experience difficulty in recognizing the symptoms, you should consult your doctor to discuss possible changes in therapy, meal plans, and/or exercise programs to help you avoid hypoglycemia.

Hyperglycemia and Diabetic Acidosis

Hyperglycemia (too much glucose in the blood) may develop if the body has too little insulin. Hyperglycemia can be brought about by:

1. Omitting your insulin or taking less than the doctor has prescribed
2. Eating significantly more than your meal plan suggests
3. Developing a fever, infection, or other significant stressful situation

In patients with insulin-dependent diabetes, prolonged hyperglycemia can result in diabetic acidosis. The first symptoms of diabetic acidosis usually come on gradually, over a period of hours or days, and include a dry mouth, flushed face, thirst, loss of appetite, and fruity odor on the breath. With acidosis, urine tests show large amounts of glucose and ketone. Heavy breathing and a rapid pulse are more severe symptoms. If untreated, prolonged hyperglycemia or diabetic acidosis can lead to nausea, vomiting, dehydration, loss of consciousness or death. Therefore, it is important that you obtain medical assistance immediately.

Lipodystrophy

Rarely, administration of insulin subcutaneously can result in lipoatrophy (depression in the skin) or lipo hypertrophy (enlargement or thickening of tissue). If you notice either of these conditions, consult your doctor. A change in your injection technique may help alleviate the problem.

Allergy to Insulin

Local Allergy - Patients occasionally experience redness, swelling, and itching at the site of injection of insulin. This condition, called local allergy, usually clears up in a few days to a few weeks. In some instances, this condition may be related to factors other than insulin, such as infection, or injected too close to the skin. If you have local reactions, contact your doctor.

Systemic Allergy - Less common, but potentially more serious, is generalized allergy to insulin, which may cause rash over the whole body, shortness of breath, wheezing, reduction in blood pressure, fast pulse, or sweating. Severe cases of generalized allergy may be life threatening. If you think you are having a generalized allergic reaction to insulin, notify your doctor immediately.

ADDITIONAL INFORMATION

Additional information about diabetes may be obtained from your diabetes educator.

DIABETES FORECAST is a national magazine designed especially for patients with diabetes and their families and is available on subscription from the American Diabetes Association, National Service Center, 1660 Duke Street, Alexandria, Virginia 22314, 1-800-DIABETES (1-800-342-4238).

Another publication, DIABETES COUNTDOWN, is available from the Juvenile Diabetes Foundation, 120 Wall Street, 12th Floor, New York, New York 10005-4001, 1-800-JDI-CURE (1-800-533-2873).

Additional information about insulin and Humulin 70/30 Pen can be obtained by calling 1-888-88-LILLY (1-888-888-4555). Literature reviewed August 3, 2000
