

1 **Accretropin™ (somatropin) Injection**

2 **[Cangene Corporation]**

3

4 **DESCRIPTION**

5

6 Accretropin™ (recombinant human growth hormone (r-hGH); somatropin) is a protein
7 produced by recombinant DNA technology. It is produced during fermentation in *E. coli*
8 yielding a protein containing 192 amino acids. The N-terminal amino acid, methionine,
9 is later removed to yield a protein that is chemically and physicochemically identical to
10 pituitary derived human growth hormone, consisting of 191 amino acids in a single
11 polypeptide chain.

12

13 Accretropin™ is distributed in a liquid solution containing 1 mL of a 5 mg/mL solution
14 of growth hormone (15 IU/mL). The formulation also contains 0.75% NaCl, 0.34%
15 Phenol (as preservative), 0.2% Pluronic F-68 (a non-ionic surfactant) and is designed for
16 subcutaneous administration. Accretropin™ is stabilized to pH 6.0 with 10 mM NaPO₄
17 buffer.

18

19 **CLINICAL PHARMACOLOGY**

20

21 **General**

22

23 *Linear Growth* — Somatropin stimulates linear growth in pediatric patients who lack
24 adequate normal endogenous growth hormone. *In vitro*, preclinical, and clinical testing
25 have demonstrated that somatropin is therapeutically equivalent to human growth
26 hormone of pituitary origin and achieves equivalent pharmacokinetic profiles in normal
27 adults.

28

29 In addition, the following actions have been demonstrated for human growth hormone
30 (somatropin and/or human growth hormone of pituitary origin).

31

32 *A. Tissue Growth* – 1. Skeletal Growth: Somatropin stimulates skeletal growth in
33 children with growth failure due to lack of adequate secretion of endogenous GH (i.e.
34 growth hormone deficiency), or in patients with Turner Syndrome. The measurable
35 increase in body length after administration of human growth hormone results from an
36 effect on the epiphysial plates of the long bones. Concentrations of IGF-1, which may
37 play a role in skeletal growth, are low in the serum of growth hormone-deficient pediatric
38 patients but increase during treatment with somatropin. Elevations in mean serum
39 alkaline phosphatase concentrations may also be seen. 2. Cell Growth: It has been shown
40 that there are fewer skeletal muscle cells in pediatric patients with short stature who lack
41 endogenous growth hormone as compared to the normal pediatric population. Treatment
42 with human growth hormone results in an increase in the size and number of skeletal
43 muscle cells.

44

45 B. *Protein Metabolism* — Linear growth is facilitated in part by increased cellular protein
46 synthesis. Nitrogen retention, as demonstrated by decreased urinary nitrogen excretion
47 and serum urea nitrogen, follows the initiation of therapy with human growth hormone.

48

49 C. *Carbohydrate Metabolism* — Growth hormone is a modulator of carbohydrate
50 metabolism. Pediatric patients with hypopituitarism sometimes experience fasting
51 hypoglycemia that is improved by treatment with somatropin. Large doses of human
52 growth hormone may impair glucose tolerance (see PRECAUTIONS, General).

53

54 D. *Lipid Metabolism* — In growth hormone-deficient patients, administration of human
55 growth hormone has resulted in lipid mobilization, reduction in body fat stores, and
56 increased plasma fatty acids.

57

58 E. *Mineral Metabolism* — Retention of sodium, potassium, and phosphorus is induced by
59 human growth hormone. Serum concentrations of inorganic phosphate increased in
60 patients with growth hormone deficiency after therapy with human growth hormone.
61 Serum calcium is not significantly altered in patients treated with human growth
62 hormone.

63

64 **Pharmacokinetics**

65

66 **Absorption** — Accretropin™ has been studied following subcutaneous administration in
67 adult volunteers. Bioavailability of Accretropin™ was not determined. However, based
68 on the bioavailability of other r-hGH products, absolute bioavailability has been
69 estimated at approximately 70% when administered subcutaneously (Janssen et al., 1999;
70 Zeisel et al., 1992).

71

72 **Distribution** — The volume of distribution of somatropin was not determined for
73 Accretropin™.

74

75 **Metabolism** — Extensive metabolism studies have not been conducted. Somatropin is
76 metabolized in the liver and kidneys. In the kidneys, hGH is catabolized to its
77 constitutive amino acids, which are then returned to the systemic circulation. Clearance
78 was not determined for Accretropin™. The mean half-life of subcutaneously
79 administered Accretropin™ is 3.63 hours (Table 1).

80

81 **Excretion** — Urinary excretion of intact somatropin has not been measured.

82

83 **Table 1: Summary of somatropin pharmacokinetic parameters in the normal**
84 **population following a 4 mg dose of Accretropin™ administered subcutaneously***

	AUC _(0-t) (ng·h/mL)	AUC _(0-inf) (ng·h/mL)	C _{max} (ng/mL)	T _{max} (h)	t _{1/2} (h)
mean ± SD	238.09 ± 44.11	255.31 ± 43.03	29.49 ± 8.32	3.50 (2-6)	3.63 ± 1.33

85 *Abbreviations: AUC_{0-t}=area under the curve until 24 hours after administration; AUC_{0-inf}=area
86 under the curve to infinity; C_{max}=maximum concentration; t_{1/2}=half-life; T_{max}=time to maximum
87 concentration (given as the median value with range); SD=standard deviation.

88

89 **Special Populations**

90

91 **Geriatric** — The pharmacokinetics of Accretropin™ have not been studied in patients
92 greater than 65 years of age.

93

94 **Pediatric** — No formal pharmacokinetic studies of r-hGH in pediatric patients have been
95 conducted using Accretropin™.

96

97 **Gender** — No studies have been performed to evaluate the effect of gender on the
98 pharmacokinetics of Accretropin™.

99

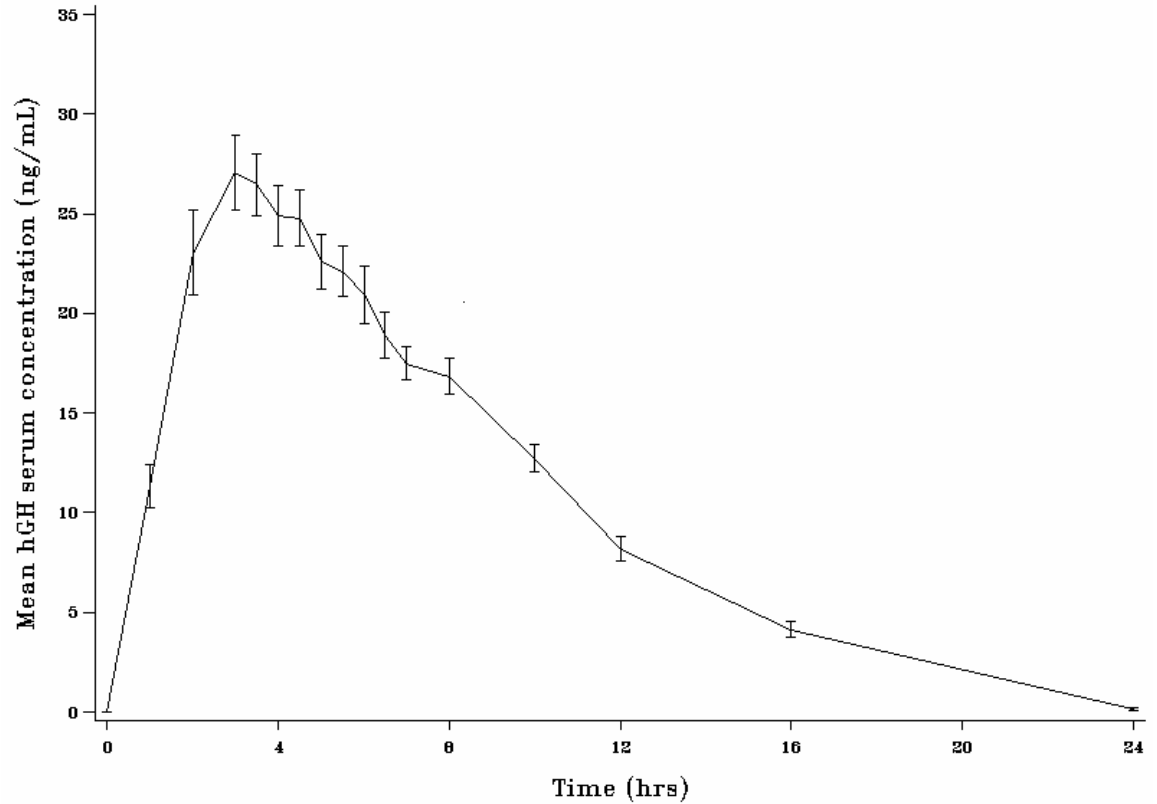

100 **Race** — No data are available.

101

102 **Renal, Hepatic insufficiency** — No studies have been performed with Accretropin™ in
103 patients with renal or hepatic insufficiency.

104

105 **Figure 1. Mean serum hGH levels over time following single dose administration.**

106
107

108 Figure 1 shows changes in mean hGH serum concentrations over time following single
109 dose administration of Accretropin™ (N= 20, data represent means ± Standard Error).

110

111 **CLINICAL TRIALS**

112

113 **Pediatric Patients with GHD**

114

115 The safety and efficacy of Accretropin™ in the treatment of pediatric patients with GHD
116 was studied in a single-arm, open-label, multicenter trial conducted in 44 patients with
117 GHD who were treated for up to 3 years with an Accretropin™ dose of 0.03 to 0.05
118 mg/kg/day (0.18 to 0.30 mg/kg/week) subcutaneously. The efficacy of Accretropin™ is
119 displayed in Table 2.

120

121 **Table 2: Height Velocity (cm/yr) and Height Velocity SDS in patients with GHD***

	Height Velocity (cm/yr)	Height Velocity SDS
	N= number of patients	N= number of patients
	Mean (cm/yr) ± SD	Mean (SDS) ± SD

Year 1	N=41 8.88 ± 2.29	N=41 3.60 ± 3.58
Year 2	N=34 7.64 ± 1.41	N=33 1.95 ± 2.32
Year 3	N=26 6.98 ± 1.62	N=26 1.76 ± 2.87

122 *Patients who entered puberty during the clinical trial were discontinued as per protocol
123 specifications.

124

125 Height SD score calculated relative to population of normally growing children increased
126 on Accretropin™ treatment from -3.04 at baseline to -2.46 at one year, -2.12 at two years,
127 and -1.78 at three years.

128

129 **Pediatric Patients with Turner Syndrome**

130

131 The safety and efficacy of Accretropin™ in the treatment of children with short stature
132 due to Turner Syndrome was evaluated in a single-arm, open-label, single-center trial
133 conducted in 37 patients treated with an Accretropin™ dose of 0.06 mg/kg/day
134 subcutaneously (0.36 mg/kg/week). The efficacy of Accretropin™ is shown in Table 3.

135

136 **Table 3: Height Velocity (cm/yr) and Height Velocity SDS in patients with Turner**
137 **Syndrome**

	Height Velocity (cm/yr) N= number of patients Mean (cm/yr) ± SD	Height Velocity SDS N= number of patients Mean (SDS) ± SD
Year 1	N=37 8.56 ± 1.71	N=37 3.08 ± 2.56
Year 2	N=36 6.85 ± 1.21	N=36 1.50 ± 1.90
Year 3	N=35 5.84 ± 1.86	N=33 0.48 ± 3.28

138

139 Height SD score calculated relative to population of Turner Syndrome patients increased
140 on Accretropin™ treatment from -3.17 at baseline to -2.67 at one year, -2.43 at two years,
141 and -2.28 at three years.

142

143 **INDICATIONS AND USAGE**

144

145 Accretropin™ (somatropin) is indicated for:

- 146 • treatment of pediatric patients who have growth failure due to an inadequate
147 secretion of normal endogenous growth hormone.
- 148 • treatment of short stature associated with Turner Syndrome in pediatric patients
149 whose epiphyses are not closed.

150

151 **CONTRAINDICATIONS**

152

153 Somatropin should not be used for growth promotion in pediatric patients with closed
154 epiphyses.

155

156 Somatropin is contraindicated in patients with proliferative or preproliferative diabetic
157 retinopathy.

158

159 In general, somatropin is contraindicated in the presence of active malignancy. Any pre-
160 existing malignancy should be inactive and its treatment complete prior to initiation of
161 therapy with somatropin. Somatropin should be discontinued if there is evidence of
162 recurrent activity. Since growth hormone deficiency may be an early sign of the presence
163 of a pituitary tumor (or, rarely, other brain tumors), the presence of such tumors should
164 be ruled out prior to initiation of treatment. Somatropin should not be used in patients
165 with any evidence of progression or recurrence of an underlying intracranial tumor.

166

167 Somatropin should not be used to treat patients who have acute critical illness due to
168 complications following open heart surgery, abdominal surgery or multiple accidental
169 trauma, or those with acute respiratory failure. Two placebo-controlled clinical trials in
170 non-growth hormone deficient adult patients (n=522) with these conditions in intensive
171 care units revealed a significant increase in mortality (41.9% vs. 19.3%) among
172 somatropin-treated patients (doses 5.3-8 mg/day) compared to those receiving placebo
173 (see WARNINGS).

174

175 Somatropin is contraindicated in patients with Prader-Willi Syndrome who are severely
176 obese or have severe respiratory impairment (see WARNINGS).

177

178

179 **WARNINGS**

180

181 See CONTRAINDICATIONS for information on increased mortality in patients with
182 acute critical illness due to complications following open heart surgery, abdominal
183 surgery, or multiple accidental trauma, or those with acute respiratory failure. The safety
184 of continuing somatropin treatment in patients receiving replacement doses for approved
185 indications who concurrently develop these illnesses has not been established. Therefore,
186 the potential benefit of treatment continuation with somatropin in patients experiencing
187 acute critical illnesses should be weighed against the potential risk.

188

189 There have been reports of fatalities after initiating therapy with somatropin in pediatric
190 patients with Prader-Willi Syndrome who had one or more of the following risk factors:
191 severe obesity, history of upper airway obstruction or sleep apnea, or unidentified
192 respiratory infection. Male patients with one or more of these factors may be at greater
193 risk than females. Patients with Prader-Willi Syndrome should be evaluated for signs of
194 upper airway obstruction and sleep apnea before initiation of treatment with somatropin.
195 If, during treatment with somatropin, patients show signs of upper airway obstruction
196 (including onset of or increased snoring) and/or new onset sleep apnea, treatment should
197 be interrupted. All patients with Prader-Willi Syndrome treated with somatropin should
198 also have effective weight control and be monitored for signs of respiratory infection,
199 which should be diagnosed as early as possible and treated aggressively (see
200 CONTRAINDICATIONS). Unless patients with Prader-Willi Syndrome also have a
201 diagnosis of growth hormone deficiency, Accretropin™ is not indicated for the long-term
202 treatment of pediatric patients who have growth failure due to genetically confirmed
203 Prader-Willi Syndrome.

204

205 **PRECAUTIONS**

206

207 **General**

208 Treatment with Accretropin™ as with other growth hormone preparations, should be
209 directed by physicians who are experienced in the diagnosis and management of pediatric
210 patients with GHD and Turner Syndrome (TS).

211

212 Treatment with somatropin may decrease insulin sensitivity, particularly at higher doses
213 in susceptible patients. As a result, previously undiagnosed impaired glucose tolerance
214 and overt diabetes mellitus may be unmasked during somatropin treatment. Therefore,
215 glucose levels should be monitored periodically in all patients treated with somatropin,
216 especially in those with risk factors for diabetes mellitus, such as obesity (including obese
217 patients with Prader-Willi Syndrome), Turner Syndrome, or a family history of diabetes
218 mellitus. Patients with preexisting type-1 or type-2 diabetes mellitus or impaired glucose
219 tolerance should be monitored closely during somatropin therapy. The doses of
220 antihyperglycemic drugs (i.e., insulin or oral agents) may require adjustment when
221 somatropin therapy is instituted in these patients.

222

223 Patients with preexisting tumors or growth hormone deficiency secondary to an
224 intracranial lesion should be examined routinely for progression or recurrence of the
225 underlying disease process. In pediatric patients, clinical literature has revealed no
226 relationship between somatropin replacement therapy and central nervous system (CNS)
227 tumor recurrence or new extracranial tumors. However, in childhood cancer survivors,
228 an increased risk of a second neoplasm has been reported in patients treated with
229 somatropin after their first neoplasm. Intracranial tumors, in particular meningiomas, in
230 patients treated with radiation to the head for their first neoplasm, were the most common
231 of these second neoplasms. In adults, it is unknown whether there is any relationship
232 between somatropin replacement therapy and CNS tumor recurrence.

233

234 Intracranial hypertension (IH) with papilledema, visual changes, headache, nausea,
235 and/or vomiting has been reported in a small number of patients treated with somatropin
236 products. Symptoms usually occurred within the first eight (8) weeks after the initiation
237 of somatropin therapy. In all reported cases, IH-associated signs and symptoms rapidly
238 resolved after cessation of therapy or a reduction of the somatropin dose. Fundoscopic
239 examination should be performed routinely before initiating treatment with somatropin to
240 exclude preexisting papilledema, and periodically during the course of somatropin
241 therapy. If papilledema is observed by funduscopy during somatropin treatment,
242 treatment should be stopped. If somatropin-induced IH is diagnosed, treatment with
243 somatropin can be restarted at a lower dose after IH-associated signs and symptoms have
244 resolved. Patients with Turner Syndrome, Prader-Willi Syndrome, and chronic renal
245 insufficiency may be at increased risk for the development of IH.

246

247 In patients with hypopituitarism (multiple hormone deficiencies), standard hormonal
248 replacement therapy should be monitored closely when somatropin therapy is
249 administered.

250

251 Undiagnosed/untreated hypothyroidism may prevent an optimal response to somatropin,
252 in particular, the growth response in children. Patients with Turner Syndrome have an
253 inherently increased risk of developing autoimmune thyroid disease and primary
254 hypothyroidism. In patients with growth hormone deficiency, central (secondary)
255 hypothyroidism may first become evident or worsen during somatropin treatment.
256 Therefore, patients treated with somatropin should have periodic thyroid function tests
257 and thyroid hormone replacement therapy should be initiated or appropriately adjusted
258 when indicated.

259

260 Patients should be monitored carefully for any malignant transformation of skin lesions.

261

262 When somatropin is administered subcutaneously at the same site over a long period of
263 time, tissue atrophy may result. This can be avoided by rotating the injection site.

264

265 As with any protein, local or systemic allergic reactions may occur. Parents/Patients
266 should be informed that such reactions are possible and that prompt medical attention
267 should be sought if allergic reactions occur.

268

269 **Pediatric Patients (see PRECAUTIONS, General)**

270 Slipped capital femoral epiphysis may occur more frequently in patients with endocrine
271 disorders (including GHD and Turner Syndrome) or in patients undergoing rapid growth.
272 Any pediatric patient with the onset of a limp or complaints of hip or knee pain during
273 somatropin therapy should be carefully evaluated.

274

275 Progression of scoliosis can occur in patients who experience rapid growth. Because
276 somatropin increases growth rate, patients with a history of scoliosis who are treated with
277 somatropin should be monitored for progression of scoliosis. However, somatropin has
278 not been shown to increase the occurrence of scoliosis. Skeletal abnormalities including

279 scoliosis are commonly seen in untreated Turner Syndrome patients. Scoliosis is also
280 commonly seen in untreated patients with Prader-Willi Syndrome. Physicians should be
281 alert to these abnormalities, which may manifest during somatropin therapy.

282

283 Patients with Turner Syndrome should be evaluated carefully for otitis media and other
284 ear disorders since these patients have an increased risk of ear and hearing disorders.
285 Somatropin treatment may increase the occurrence of otitis media in patients with Turner
286 Syndrome. In addition, patients with Turner Syndrome should be monitored closely for
287 cardiovascular disorders (e.g., stroke, aortic aneurysm/dissection, hypertension).

288

289 **Adult Patients**

290 The safety and effectiveness of Accretropin™ in adult patients have not been evaluated in
291 clinical studies.

292

293 **Geriatric Use**

294 The safety and effectiveness of somatropin in patients aged 65 and over have not been
295 evaluated in clinical studies.

296

297 **Drug Interactions**

298 Somatropin inhibits 11 β -hydroxysteroid dehydrogenase type 1 (11 β HSD-1) in
299 adipose/hepatic tissue and may significantly impact the metabolism of cortisol and
300 cortisone. As a consequence, in patients treated with somatropin, previously
301 undiagnosed central (secondary) hypoadrenalism may be unmasked requiring
302 glucocorticoid replacement therapy. In addition, patients treated with glucocorticoid
303 replacement therapy for previously diagnosed hypoadrenalism may require an increase in
304 their maintenance or stress doses; this may be especially true for patients treated with
305 cortisone acetate and prednisone since conversion of these drugs to their biologically
306 active metabolites is dependent on the activity of the 11 β HSD-1 enzyme.

307

308 Excessive glucocorticoid therapy may attenuate the growth promoting effects of
309 somatropin in children. Therefore, glucocorticoid replacement therapy should be
310 carefully adjusted in children with concomitant GH and glucocorticoid deficiency to
311 avoid both hypoadrenalism and an inhibitory effect on growth.

312

313 Limited published data indicate that somatropin treatment increases cytochrome P450
314 (CP450) mediated antipyrine clearance in man. These data suggest that somatropin
315 administration may alter the clearance of compounds known to be metabolized by CP450
316 liver enzymes (e.g., corticosteroids, sex steroids, anticonvulsants, cyclosporine). Careful
317 monitoring is advisable when somatropin is administered in combination with other drugs
318 known to be metabolized by CP450 liver enzymes. However, formal drug interaction
319 studies have not been conducted.

320

321 In patients with diabetes mellitus requiring drug therapy, the dose of insulin and/or oral
322 agent may require adjustment when somatropin therapy is initiated (see
323 PRECAUTIONS, General).

324

325 **Carcinogenesis, Mutagenesis, Impairment of Fertility**

326 Long-term animal studies for carcinogenicity, mutagenicity and impairment of fertility
327 with Accretropin™ have not been performed.

328

329 **Pregnancy**

330 *Pregnancy Category C* — Animal reproduction studies have not been conducted with
331 Accretropin™. It is not known whether Accretropin™ can cause fetal harm when
332 administered to a pregnant woman or can affect reproductive capacity. Somatropin
333 should be given to a pregnant woman only if clearly needed.

334

335 **Nursing Mothers**

336 There have been no studies conducted with Accretropin™ in nursing mothers. It is not
337 known whether this drug is excreted in human milk. Because many drugs are excreted in
338 human milk, caution should be exercised when somatropin is administered to a nursing
339 woman.

340

341 **ADVERSE REACTIONS**

342

343 As with all protein pharmaceuticals, some patients may develop antibodies to the protein.
344 Over 3 years of Accretropin™ therapy, no patient with growth hormone deficiency or
345 Turner syndrome developed anti-GH antibodies with binding capacities greater than 0.67
346 mg/L, which is below the threshold at which attenuation of growth velocity has been
347 observed. Anti-GH antibody titers peaked by 6-12 months and remained stable or
348 declined subsequently. Anti-E.coli antibody titers increased slightly during
349 Accretropin™ treatment. No growth attenuation was noted in any patient who developed
350 anti-hGH or anti-E. coli antibodies.

351

352 **Pediatric Growth Hormone-Deficient Patients**

353

354 In the clinical study conducted in children with GHD injection site reactions were the
355 most frequent treatment-related adverse event reported in 50% of patients (includes the
356 following descriptions: bruising, erythema, hemorrhage, edema, pain, pruritis, rash,
357 swelling). Other treatment-related adverse events (as assessed by the investigators) with
358 a frequency $\geq 3\%$ were nausea, headache, fatigue, and scoliosis. One patient with pre-
359 existing type-1 diabetes required adjustment of the insulin dose under observation. See
360 also growth hormone associated adverse events under PRECAUTIONS and
361 WARNINGS.

362

363 **Turner Syndrome Patients**

364

365 In the clinical study conducted in pediatric patients with Turner Syndrome the only
366 treatment-related adverse event (as assessed by the investigators) that occurred in $\geq 3\%$ of
367 patients was injection site reaction which occurred in 32% of patients (includes the
368 following descriptions: erythema, edema, pain, pruritis). See also growth hormone
369 associated adverse events under PRECAUTIONS and WARNINGS.

370

371 **OVERDOSAGE**

372

373 Acute overdosage could lead initially to hypoglycemia and subsequently to
374 hyperglycemia. Long-term overdosage could result in signs and symptoms of
375 gigantism/acromegaly consistent with the known effects of excess human growth
376 hormone.

377

378 **DOSAGE AND ADMINISTRATION**

379

380 The dose regimen for Accretropin™ [(somatropin) for injection] should be individualized
381 for each patient. Therapy should not be continued if epiphyseal fusion has occurred.
382 Response to growth hormone therapy tends to decrease with time. However, failure to
383 increase growth rate, particularly during the first year of therapy, should prompt close
384 assessment of compliance and evaluation of other causes of growth failure such as
385 hypothyroidism, under-nutrition and advanced bone age.

386

387 **Growth hormone deficiency** – The recommended weekly dose is 0.18 mg/kg body
388 weight to 0.3 mg/kg (0.90 IU/kg) body weight. The dose should be divided into equal
389 daily doses given 6 or 7 times per week subcutaneously.

390

391 **Turner Syndrome** – The recommended weekly dose is 0.36 mg/kg of body weight. The
392 dose should be divided into equal daily doses given 6 or 7 times per week
393 subcutaneously.

394

395 **Accretropin™ should not be injected intravenously.**

396

397 **Administration** – the vial should be swirled with a GENTLE rotary motion. DO NOT
398 SHAKE. The solution should be inspected for clarity. It should be clear. If the solution
399 is cloudy or contains particles, the contents MUST NOT be injected.

400

401 **STORAGE**

402

403 Vials of Accretropin™ Injection should be stored in the refrigerator [2° to 8°C (36° to
404 46°F)]. Avoid freezing and shaking. Expiration dates are stated on the vial and carton

405 labels. Do not use after expiration date. Once opened, Accretropin™ may be stored up
406 to 14 days when refrigerated [2° to 8°C (36° to 46°F)]. Discard 14 days after first use.
407 Protect from light.

408

409 Rx only.

410

411 **HOW SUPPLIED**

412

413 **NDC Number Contents**

414

415 60492-0162-1 A single vial carton containing one multidose vial and a package
416 insert.
