HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use TRADENAME safely and effectively. See full prescribing information for TRADENAME.

TRADENAME (itraconazole)
Initial U.S. Approval: 1992

WARNING: CONGESTIVE HEART FAILURE, CARDIAC EFFETS AND DRUG INTERACTIONS
See full prescribing information for complete boxed warning.
• Do not administer for the treatment of onychomycosis in patients with evidence of ventricular dysfunction such as congestive heart failure (CHF) or a history of CHF. (4)
• If signs or symptoms of congestive heart failure occur during administration, discontinue administration. (4)
• Negative inotropic effects were seen when itraconazole was administered intravenously to dogs and healthy human volunteers. (5.3)
• Drug Interactions: Coadministration of certain drugs is contraindicated. See complete boxed warning. (7)
• May increase plasma concentrations of drugs metabolized by the cytochrome P450 3A4 isoenzyme system (CYP3A4) pathway. (7)
• Serious cardiovascular events, including QT prolongation, torsades de pointes, ventricular tachycardia, cardiac arrest, and/or sudden death have occurred in patients using certain drugs. See complete boxed warning. (5.2)

INDICATIONS AND USAGE
• TRADENAME, an azole antifungal, are indicated for the treatment of onychomycosis of the toenail caused by Trichophyton rubrum or T. mentagrophytes. (1)

DOSE AND ADMINISTRATION
• Onychomycosis of the toenail: recommended dose is 200 mg (one tablet) once daily for 12 consecutive weeks. (2)
• Take with a full meal at the same time each day. (2)

DOSE FORMS AND STRENGTHS
• Tablets: 200 mg (3)

CONTRAINDICATIONS
• Do not administer for the treatment of onychomycosis in patients with evidence of ventricular dysfunction such as congestive heart failure (CHF) or a history of CHF. (4)
• Do not administer for the treatment of onychomycosis to pregnant women or to women contemplating pregnancy. (4, 8.1)
• Coadministration of cisapride, doxifetilide, ergot alkaloids such as methylergometrine (methylergonovine), felodipine, dihydroergotamine, ergotamine, ergometrine (ergonovine), and triazolam with TRADENAME is contraindicated. (4)

ADVERSE REACTIONS
• Most common adverse reactions observed in the treatment phase of the onychomycosis clinical trial (>1%) are upper respiratory tract infections, increased hepatic enzymes, hypeoacusis, headache, abdominal pain, diarrhea, nausea, fatigue, arhythmia, cough, sore throat and back pain. (6.1)
• Itraconazole has been associated with rare cases of serious hepatotoxicity, including liver failure and death. (6.1)
To report SUSPECTED ADVERSE REACTIONS, contact Stiefel Laboratories, Inc. at (1-866-440-5508) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG INTERACTIONS
• Concomitant administration of TRADENAME with certain drugs metabolized by the cytochrome P450 3A4 isoenzyme system (CYP3A4) or transported by P-glycoprotein may result in increased plasma concentrations of those drugs, leading to potentially serious and/or life-threatening adverse events. (7.1)
• Drug Interactions with the following drugs or classes of drugs may occur: Antiarrhythmics, Anticonvulsants, Anti-HIV Agents, Antimycobacterials, Antineoplastics, Antipsychotics, Benzodiazepines, Calcium Channel Blockers, Gastric Acid Suppressors/Neutralizers, Gastrointestinal Motility Agents, HMG CoA-Reductase Inhibitors, Macrolide Antibiotics, Oral Hypoglycemic Agents, Polyenes, Opiate Analgesics. Not all drug interactions are included in Highlights. See Full Prescribing Information for complete listing. (7)

USE IN SPECIFIC POPULATIONS
• Pregnancy: Based on animal data, may cause fetal harm. (8.1)
• Nursing Mothers: Itraconazole is excreted in human milk (8.3)
• Pediatric Use: The efficacy and safety have not been established in pediatric patients. No pharmacokinetic data are available in children. (8.4)

See 17 for PATIENT COUNSELING INFORMATION and FDA-Approved patient labeling. Revised: April 2010

*Sections or subsections omitted from the full prescribing information are not listed.
WARNING: CONGESTIVE HEART FAILURE, CARDIAC EFFECTS, AND DRUG INTERACTIONS
Do not administer TRADENAME for the treatment of onychomycosis in patients with evidence of ventricular
dysfunction such as congestive heart failure (CHF) or a history of CHF. When itraconazole was administered intravenously
to dogs and healthy human volunteers, negative inotropic effects were seen. If signs or symptoms of congestive heart failure
occur during administration of TRADENAME, discontinue administration. [See Contraindications (4), Warnings and
Precautions (5), Drug Interactions (7), and Clinical Pharmacology (12)]

Drug Interactions: Coadministration of cisapride, pimozide, quinidine, dofe tilide, levacetylmethadol (levomethadyl),
felodipine, oral midazolam, nisoldipine, triazolam, lovastatin, simvastatin, ergot alkaloids such as dihydroergotamine,
ergometrine (ergonovine), ergotamine and methylergometrine (methylergonovine) or methadone with TRADENAME is
contraindicated. TRADENAME, a potent cytochrome P450 3A4 isoenzyme system (CYP3A4) inhibitor, may increase plasma
concentrations of drugs metabolized by this pathway. Serious cardiovascular events, including QT prolongation, torsades de
pointes, ventricular tachycardia, cardiac arrest, and/or sudden death have occurred in patients using cisapride, pimozide,
levacetylmethadol (levomethadyl), methadone or quinidine concomitantly with itraconazole and/or other CYP3A4 inhibitors.
[See Contraindications (4), Warnings and Precautions (5), and Drug Interactions (7)]

1 INDICATIONS AND USAGE
TRADENAME is indicated for the treatment of onychomycosis of the toenail due to Trichophyton rubrum or T.
mentagrophytes in non-immunocompromised patients. Prior to initiating treatment, appropriate nail specimens for laboratory
testing (KOH preparation, fungal culture, or nail biopsy) should be obtained to confirm the diagnosis of onychomycosis. [See
Contraindications (4), Warnings and Precautions (5), Drug Interactions (7), and Clinical Pharmacology (12).]

2 DOSAGE AND ADMINISTRATION
TRADENAME should be taken with a full meal at the same time each day. The recommended dose is 200 mg (one tablet)
one daily for 12 consecutive weeks.

Use in Patients with Renal Impairment:
Limited data are available on the use of oral itraconazole in patients with renal impairment. Caution should be exercised
when TRADENAME is administered to patients with renal impairment. [See Clinical Pharmacology (12) and Warnings and
Precautions (5).]

Use in Patients with Hepatic Impairment:
Limited data are available on the use of oral itraconazole in patients with hepatic impairment. Caution should be exercised
when TRADENAME is administered to patients with hepatic impairment. [See Clinical Pharmacology (12) and Warnings
and Precautions (5).]

3 DOSAGE FORMS AND STRENGTHS
TRADENAME contain 200 mg of itraconazole, as a white to slightly grey, oblong, biconvex tablet engraved with
“BARRIER” on one side and “It 200” on the other side.

4 CONTRAINDICATIONS
Congestive Heart Failure: Do not administer TRADENAME for the treatment of onychomycosis in patients with evidence of
ventricular dysfunction such as congestive heart failure (CHF) or a history of CHF. [See Warnings and Precautions (5), Drug
Interactions (7), and Clinical Pharmacology (12).]

Drug Interaction: Concomitant administration of TRADENAME and certain drugs that are metabolized by the cytochrome
P450 3A4 isoenzyme system (CYP3A4) or where gastrointestinal absorption is regulated by P-gp may result in increased
plasma concentrations of those drugs, leading to potentially serious and/or life-threatening adverse events.

Coadministration of cisapride, dofe tilide, ergot alkaloids such as dihydroergotamine, ergotamine, ergometrine (ergonovine),
and methyl ergometrine (methylergonovine), felodipine, levacetylmethadol (levomethadyl), lovastatin, methadone, oral
midazolam, nisoldipine, pimozide, quinidine, simvastatin, and triazolam with TRADENAME is contraindicated.

Do not administer TRADENAME for the treatment of onychomycosis to pregnant patients or to women contemplating
pregnancy.

Anaphylaxis and hypersensitivity have been reported with use of itraconazole. TRADENAME is contraindicated for patients
who have shown hypersensitivity to itraconazole products.

2
5 WARNINGS AND PRECAUTIONS

5.1 Congestive Heart Failure, Peripheral Edema, and Pulmonary Edema
Cases of CHF, peripheral edema, and pulmonary edema have been reported with itraconazole administration among patients being treated for onychomycosis and/or systemic fungal infections. [See Contraindications (4), Warnings and Precautions (5), and Clinical Pharmacology (12).]

5.2 Cardiac Dysrhythmias
Life-threatening cardiac dysrhythmias and/or sudden death have occurred in patients using cisapride, pimozide, levacetylmethadol (levomethadyl), methadone, or quinidine concomitantly with itraconazole and/or other CYP3A4 inhibitors. Concomitant administration of these drugs with TRADENAME is contraindicated. [See Boxed Warning, Contraindications (4), Warnings and Precautions (5), and Drug Interactions (7).]

5.3 Cardiac Disease
TRADENAME should not be administered in patients with evidence of ventricular dysfunction such as congestive heart failure (CHF) or a history of CHF.

Itraconazole has been shown to have a negative inotropic effect. When itraconazole was administered intravenously to anesthetized dogs, a dose-related negative inotropic effect was documented. In a healthy volunteer study of itraconazole injection, transient, asymptomatic decreases in left ventricular ejection fraction were observed using gated SPECT imaging; these resolved before the next infusion, 12 hours later.

For patients with risk factors for congestive heart failure, physicians should carefully review the risks and benefits of TRADENAME therapy. These risk factors include cardiac disease such as ischemic and valvular disease; significant pulmonary disease such as chronic obstructive pulmonary disease; and renal failure and other edematous disorders. Such patients should be informed of the signs and symptoms of CHF, should be treated with caution, and should be monitored for signs and symptoms of CHF during treatment. If signs or symptoms of CHF appear during administration of TRADENAME, discontinue administration.

5.4 Hepatic Effects
Itraconazole has been associated with rare cases of serious hepatotoxicity, including liver failure and death. Some of these cases had neither pre-existing liver disease nor a serious underlying medical condition, and some of these cases developed within the first week of treatment. If clinical signs or symptoms develop that are consistent with hepatotoxicity, treatment should be discontinued immediately and liver function testing performed.

In patients with elevated or abnormal liver enzymes or active liver disease, or who have experienced liver toxicity with other drugs, treatment with itraconazole is not recommended. Liver function monitoring should be done in patients with pre-existing hepatic function abnormalities or those who have experienced liver toxicity with other medications and should be considered in all patients receiving TRADENAME.

5.5 Calcium Channel Blockers
Calcium channel blockers can have negative inotropic effects which may be additive to those of itraconazole. In addition, itraconazole can inhibit the metabolism of calcium channel blockers. Therefore, caution should be used when co-administering itraconazole and calcium channel blockers due to an increased risk of CHF. Concomitant administration of TRADENAME and nisoldipine is contraindicated.

5.6 Neuropathy
If neuropathy occurs that may be attributable to TRADENAME, the treatment should be discontinued.

5.7 Hearing Loss
Transient or permanent hearing loss has been reported in patients receiving treatment with itraconazole. Several of these reports included concurrent administration of quinidine which is contraindicated. [See Boxed Warning, Warnings and Precautions (5), and Drug Interactions (7).] The hearing loss usually resolves when treatment is stopped, but can persist in some patients.

6 ADVERSE REACTIONS

6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, the adverse reaction rate observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.
Patients in the trial for toenail onychomycosis were treated with a dosing regimen of 200 mg once daily for 12 consecutive weeks.

The most commonly reported adverse reaction leading to discontinuation of TRADENAME was increased hepatic enzyme (6 subjects, 1.0%), followed by dizziness (3 subjects, 0.5%). No other adverse reaction leading to discontinuation occurred in more than one subject.

The table below lists all adverse events reported by at least 1% of patients who received TRADENAME during 12 weeks of treatment:

Table 1: Adverse Reactions Occurring at Frequencies ≥ 1% in the Onychomycosis Clinical Trial

6.2 Post Marketing Experience
The following adverse reactions have been identified during post-approval use of itraconazole (all formulations) and are listed in Table 2 below. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establishing a causal relationship to drug exposure.

7 DRUG INTERACTIONS

7.1 Effects of TRADENAME on Other Drugs
Itraconazole and its major metabolite, hydroxy-itraconazole, are strong inhibitors of the cytochrome P450 3A4 isoenzyme system (CYP3A4). Therefore, concomitant administration of TRADENAME and certain drugs metabolized by the cytochrome CYP3A4 may result in increased plasma concentrations of those drugs due to decreased elimination, leading to potentially serious and/or life-threatening adverse events. Itraconazole is also an inhibitor of P-glycoprotein (P-gp) transporter and may result in increased plasma concentrations of drugs whose gastrointestinal absorption is regulated by P-gp. Whenever possible, plasma concentrations of these drugs should be monitored, and dosage adjustments made after concomitant TRADENAME therapy is initiated. When appropriate, clinical monitoring for signs or symptoms of increased or prolonged pharmacologic effects is advised. Upon discontinuation, itraconazole plasma concentrations decline gradually (especially in patients with hepatic cirrhosis or in those receiving CYP3A4 inhibitors). This is particularly important when initiating therapy with drugs whose metabolism is affected by itraconazole.
7.2 Effects of Other Drugs on TRADENAME
Inducers of CYP3A4 may decrease the plasma concentrations of itraconazole. TRADENAME may not be effective in patients concomitantly taking TRADENAME and one of these drugs. Therefore, administration of these drugs with TRADENAME is not recommended.

Inhibitors of CYP3A4 may increase the plasma concentrations of itraconazole. Patients who must take TRADENAME concomitantly with one of these drugs should be monitored closely for signs or symptoms of increased or prolonged pharmacologic effects of TRADENAME.

1This list is not all-inclusive.
2For information on parenterally administered midazolam, see the Benzodiazepine paragraph below.

Antiarrhythmics
The Class IA antiarrhythmic, quinidine and class III antiarrhythmic, dofetilide are known to prolong the QT interval. Coadministration of quinidine or dofetilide with itraconazole may increase plasma concentrations of quinidine or dofetilide,
which could result in serious cardiovascular events. Therefore, concomitant administration of TRADENAME and quinidine or dofetilide is contraindicated. [See Boxed Warning, Contraindications (4), and Warnings and Precautions (5).]

The Class IA antiarrhythmic, disopyramide has the potential to increase the QT interval at high plasma concentrations. Caution is advised when TRADENAME and disopyramide are administered concomitantly.

Concomitant administration of digoxin and itraconazole has led to increased plasma concentrations of digoxin via inhibition of P-glycoprotein.

**Anticonvulsants**
Carbamazepine, phenobarbital, and phenytoin are all inducers of CYP3A4. Reduced plasma concentrations of itraconazole were reported when itraconazole was administered concomitantly with phenytoin. Although interactions with carbamazepine and phenobarbital have not been studied, concomitant administration of TRADENAME and these drugs would be expected to result in decreased plasma concentrations of itraconazole. In addition, in vivo studies have demonstrated an increase in plasma carbamazepine concentrations in subjects concomitantly receiving ketoconazole. Although there are no data regarding the effect of itraconazole on carbamazepine metabolism, because of the similarities between ketoconazole and itraconazole, concomitant administration of TRADENAME and carbamazepine may inhibit the metabolism of carbamazepine.

**Anti-HIV Agents**
Non-nucleoside Reverse Transcriptase Inhibitors (NNRTI) such as nevirapine and efavirenz are inducers of CYP3A4. Human pharmacokinetic studies have shown that efavirenz, when concomitantly administered with itraconazole, greatly decreased serum concentrations of itraconazole and hydroxyl-itraconazole. Concomitant use of TRADENAME and efavirenz is not recommended.

In vivo studies have shown that nevirapine induces the metabolism of ketoconazole, significantly reducing the bioavailability of ketoconazole. Studies involving nevirapine and itraconazole have not been conducted. However, because of the similarities between ketoconazole and itraconazole, concomitant administration of TRADENAME and nevirapine is not recommended.

Concomitant administration of TRADENAME and protease inhibitors metabolized by CYP3A4, such as indinavir, ritonavir, and saquinavir, may increase plasma concentrations of these protease inhibitors. In addition, concomitant administration of TRADENAME and indinavir and ritonavir (but not saquinavir) may increase plasma concentrations of itraconazole. Caution is advised when TRADENAME and protease inhibitors must be given concomitantly.

Concomitant administration of TRADENAME and maraviroc has been reported to increase plasma concentration of maraviroc. The dose of maraviroc should be decreased to 150 mg twice daily when given in combination with itraconazole.

**Antimycobacterials**
Drug interaction studies have demonstrated that plasma concentrations of azole antifungal agents and their metabolites, including itraconazole and hydroxyitraconazole, were significantly decreased when these agents were given concomitantly with rifabutin or rifampin. In vivo data suggest that rifabutin is metabolized in part by CYP3A4. TRADENAME may inhibit the metabolism of rifabutin. Although no formal study data are available for isoniazid, similar effects should be anticipated. Therefore, the efficacy of TRADENAME could be substantially reduced if given concomitantly with one of these agents and coadministration is not recommended.

**Antineoplastics**
TRADENAME may inhibit the metabolism of busulfan, docetaxel, and vinca alkaloids.

**Antipsychotics**
Pimozide is known to prolong the QT interval and is partially metabolized by CYP3A4. Coadministration of pimozide with itraconazole could result in serious cardiovascular events. Therefore, concomitant administration of TRADENAME and pimozide is contraindicated. [See Boxed Warning, Contraindications (4), and Warnings and Precautions (5).]

Increases in plasma aripiprazole concentrations have been demonstrated in subjects concomitantly receiving ketoconazole, requiring a reduction of the aripiprazole dose. Because of the similarities between ketoconazole and itraconazole, a similar dose reduction for aripiprazole is recommended when patients concomitantly receive itraconazole and aripiprazole.

**Benzodiazepines**
Concomitant administration of itraconazole and alprazolam, diazepam, oral midazolam, or triazolam could lead to increased plasma concentrations of these benzodiazepines. Increased plasma concentrations could potentiate and prolong hypnotic and sedative effects. Concomitant administration of TRADENAME and oral midazolam or triazolam is contraindicated. [See
Contraindications (4), and Warnings and Precautions (5).

If midazolam is administered parenterally, special precaution and patient monitoring is required since the sedative effect may be prolonged.

**Calcium Channel Blockers**

Calcium channel blockers can have a negative inotropic effect which may be additive to those of itraconazole; itraconazole can inhibit the metabolism of calcium channel blockers such as dihydropyridines (e.g., nifedipine, nisoldipine, and felodipine) and verapamil. Therefore, caution should be used when co-administering itraconazole and calcium channel blockers due to an increased risk of CHF.

Concomitant administration of TRADENAME and nisoldipine results in clinically significant increases in nisoldipine plasma concentrations, which cannot be managed by dosage reduction, therefore the concomitant administration of TRADENAME and nisoldipine is contraindicated. A clinical study showed that felodipine exposure was increased by co-administration of itraconazole, resulting in approximately 6-fold increase in the AUC and 8-fold increase in the Cmax. The concomitant use of TRADENAME and felodipine is contraindicated. [See Contraindications (4), Warnings and Precautions (5), Drug Interactions (7), and Clinical Pharmacology(12).]

Edema has been reported in patients concomitantly receiving itraconazole and dihydropyridine calcium channel blockers. Appropriate dosage adjustment may be necessary.

**Gastric Acid Suppressors/Neutralizers**

Reduced plasma concentrations of itraconazole were reported when administered concomitantly with H2-receptor antagonists. Studies have shown that absorption of itraconazole is impaired when gastric acid production is decreased. TRADENAME should be administered with a cola beverage if the patient has achlorhydria or is taking H2-receptor antagonists or other gastric acid suppressors. It is advised that antacids be administered at least 1 hour before or 2 hours after administration of TRADENAME. In a clinical study, when itraconazole capsules were administered with omeprazole (a proton pump inhibitor), the bioavailability of itraconazole was significantly reduced.

**Gastrointestinal Motility Agents**

Concomitant administration of itraconazole with cisapride can elevate plasma cisapride concentrations, which could result in serious cardiovascular events. Therefore, concomitant administration of TRADENAME with cisapride is contraindicated. [See Boxed Warning, Contraindications (4), and Warnings and Precautions (5).]

**3-Hydroxy-3-Methyl-Glutaryl CoA-Reductase Inhibitors**

Human pharmacokinetic data suggest that itraconazole inhibits the metabolism of atorvastatin, cerivastatin, lovastatin, and simvastatin, which may increase the risk of skeletal muscle toxicity, including rhabdomyolysis. Concomitant administration of TRADENAME with 3-Hydroxy-3-Methyl-Glutaryl (HMG) CoA-Reductase inhibitors, such as lovastatin and simvastatin, is contraindicated. [See Contraindications (4), and Warnings and Precautions (5).]

**Immunosuppressants**

Concomitant administration of TRADENAME and cyclosporine or tacrolimus has led to increased plasma concentrations of these immunosuppressants. Similarly, concomitant administration of TRADENAME and sirolimus could increase plasma concentrations of sirolimus.

Monitoring of blood concentrations of cyclosporine, tacrolimus, or sirolimus are recommended when TRADENAME is coadministered with these immunosuppressants and appropriate dosage adjustments should be made.

**Macrolide Antibiotics**

Erythromycin and clarithromycin are known inhibitors of CYP3A4 (See Table 3) and may increase plasma concentrations of itraconazole.

**Oral Hypoglycemic Agents**

Severe hypoglycemia has been reported in patients concomitantly receiving azole antifungal agents and oral hypoglycemic agents. A human pharmacokinetic study showed that co-administration with itraconazole and a single dose of repaglinide (on the third day of a regimen of 200 mg initial dose, twice-daily 100 mg itraconazole) resulted in a 1.4-fold higher repaglinide AUC. Blood glucose concentrations should be carefully monitored when TRADENAME and oral hypoglycemic agents are coadministered.

**Polyenes Antifungal Agents**

Prior treatment with itraconazole, like other azoles, may reduce or inhibit the activity of polyenes such as amphotericin B. However, the clinical significance of this drug effect has not been clearly defined.
Opiate Analgesics
Levacetylmethadol (levomethadyl) and methadone are known to prolong the QT interval and are metabolized by CYP3A4. Co-administration of methadone or levacetylmethadol with itraconazole could result in serious cardiovascular events. Therefore, concomitant administration of TRADENAME and methadone or levacetylmethadol are contraindicated. Fentanyl plasma concentrations could be increased or prolonged by concomitant use of itraconazole and may cause potentially fatal respiratory depression.

In vitro data suggest that alfentanil is metabolized by CYP3A4. Administration with itraconazole may increase plasma concentrations of alfentanil.

Other
- Elevated concentrations of ergot alkaloids can cause ergotism, i.e., a risk for vasospasm potentially leading to cerebral ischemia and/or ischemia of the extremities. Concomitant administration of ergot alkaloids such as dihydroergotamine, ergometrine (ergonovine), ergotamine and methylergometrine (methylergonoovine) with TRADENAME is contraindicated.
- Halofantrine has the potential to prolong the QT interval at high plasma concentrations. Caution is advised when TRADENAME and halofantrine are administered concomitantly.
- Human pharmacokinetic data suggest that concomitant administration of itraconazole and buspirone results in significant increases in plasma concentrations of buspirone.
- Itraconazole may inhibit the metabolism of certain glucocorticosteroids such as budesonide, dexamethasone, fluticasone and methylprednisolone.
- Itraconazole enhances the anticoagulant effect of coumarin-like drugs, such as warfarin.
- Cilostazol and eletriptan are CYP3A4 metabolized drugs that should be used with caution when co-administered with TRADENAME.
- Co-administration of itraconazole with meloxicam decreased peak plasma concentrations and the exposure of meloxicam by 64% and 37%, respectively. Monitor patients for responses to meloxicam when itraconazole is concomitantly administered and dose adjustment should be considered if warranted.
- Co-administration of itraconazole with fexofenadine increased the peak plasma concentration and the total exposure of fexofenadine by approximately 3-fold and augmented its anti-histamine effects.
- Co-administration of itraconazole with loperamide increased peak plasma concentrations of loperamide by 3-fold and the total exposure by 3.9-fold. In addition, itraconazole is an inhibitor of P-glycoprotein and may inhibit the transport of loperamide out of the brain, leading to elevated concentrations of loperamide in the brain. Patients should be monitored for signs and symptoms of loperamide overdose, such as CNS depression, including drowsiness, dizziness and respiratory depression, and a dose or dosing frequency should be adjusted as necessary.

8 USE IN SPECIFIC POPULATIONS
8.1 Pregnancy
Teratogenic effects. Pregnancy Category C
There are no adequate and well-controlled clinical trials in the pregnant women with itraconazole. However, cases of congenital abnormalities have been reported with itraconazole drug products in post-marketing reports. Therefore, TRADENAME should not be administered to pregnant women, women planning pregnancy, or women of child bearing potential unless these onychomycosis patients are using effective contraception measures to prevent pregnancy. Effective contraceptive measures should continue throughout the treatment period and for two months thereafter. TRADENAME should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Itraconazole produced a significant dose-related increase in maternal toxicity, embryotoxicity, and teratogenicity in rats at dose levels of 40-160 mg/kg/day (2-10 times the maximum recommended human dose [MRHD], based on mg/m²/day comparisons), and in mice at 80 mg/kg/day (2 times MRHD, based on mg/m²/day comparisons). Teratogenic changes in rats included major skeletal defects; encephalocele and/or macroglossia developed in mice.

8.3 Nursing Mothers
Itraconazole is excreted in human milk; therefore, the expected benefits of TRADENAME therapy for the mother should be weighed against the potential risk from exposure of itraconazole to the infant.

8.4 Pediatric Use
The safety and effectiveness of TRADENAME in pediatric patients have not been established. No pharmacokinetic data on TRADENAME are available in children.
8.5 Geriatric Use
TRADEMARK were evaluated in 42 of 593 subjects (7.1%) greater than 65 years of age.

Transient or permanent hearing loss has been reported in elderly patients receiving treatment with itraconazole. Several of these reports included concurrent administration of quinidine which is contraindicated. [See Boxed Warning, Contraindications (4), Drug Interactions (7), and Warnings and Precautions (5).] Itraconazole should be used with care in elderly patients. [See Warnings and Precautions (5).]

8.6 Renal Impairment
Limited data are available on the use of oral itraconazole in patients with renal impairment. Caution should be exercised when TRADEMARK is administered to patients with renal impairment. [See Clinical Pharmacology (12.5) and Dosage and Administration (2).]

8.7 Hepatic Impairment
Limited data are available on the use of oral itraconazole in patients with hepatic impairment. Caution should be exercised when TRADEMARK is administered to patients with hepatic impairment. [See Clinical Pharmacology (12.5) and Dosage and Administration (2).]

10 OVERDOSAGE
Itraconazole is not removed by dialysis. In the event of accidental overdosage, supportive measures, including gastric lavage with sodium bicarbonate, should be employed.

11 DESCRIPTION
TRADEMARK (itraconazole) is a synthetic triazole antifungal agent for oral use. Itraconazole is a 1:1:1:1 racemic mixture of four diastereomers (two enantiomeric pairs), each possessing three chiral centers. It may be represented by the following structural formula and nomenclature:

```
(±)-cis-4-[4-[4-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolane-4-ylmethoxy]phenyl]-1-piperazinyllphenyl]-2,4-dihydro-2-(1-methylpropyl)-3H-1,2,4-triazol-3-one
```

Itraconazole has a molecular formula of C_{35}H_{38}Cl_{2}N_{8}O_{4} and a molecular weight of 705.64. It is a white to slightly yellowish powder. It is insoluble in water, very slightly soluble in alcohols, and freely soluble in dichloromethane. It has a pKa of 3.70 (based on extrapolation of values obtained from methanolic solutions) and a log (n-octanol/water) partition coefficient of 5.66 at pH 8.1.

Each TRADEMARK is formulated for melt extrusion technology and contains 200 mg of itraconazole and the following inactive ingredients: colloidal silicon dioxide, crospovidone, hydrogenated vegetable oil, hypromellose, lactose, microcrystalline cellulose, magnesium stearate, propylene glycol, talc, and titanium dioxide.

12 CLINICAL PHARMACOLOGY
12.1 Mechanism of Action
Itraconazole, an azole, is an antifungal agent [See Clinical Pharmacology (12) and Microbiology (12.4)].

12.3 Pharmacokinetics
The oral bioavailability of itraconazole is increased when TRADEMARK is taken with a FDA standard high-fat meal. The pharmacokinetic parameters of itraconazole and hydroxy-itraconazole after administration of one TRADEMARK to 9 male and 9 female healthy subjects in fasting and in fed conditions are presented in the table below:
Table 5: Pharmacokinetic Parameters Following a Single Dose of TRADENAME (mean ± SD)

** Drug given after FDA standard high-fat breakfast

The steady-state pharmacokinetics of itraconazole and hydroxy-itraconazole were analyzed after oral dosing of 16 healthy volunteers with one TRADENAME following a moderate-fat breakfast once daily for 14 days in an open-label study. Mean maximum plasma levels of itraconazole and hydroxy-itraconazole increased from Day 1 to Day 14 by approximately 6- and 4-fold, respectively. The respective pharmacokinetic parameters from this study are reflected in the table below:

Table 6: Pharmacokinetic Parameters Following Multiple Doses of TRADENAME (mean ± SD) Taken with Moderate-fat Breakfasts*

*Meal containing approximately 500 calories, 30% of which were derived from fat.

In a 2-period, open-label, randomized, cross-over, pivotal bioequivalence study to assess the comparative bioavailability of the TRADENAME and a marketed 100-mg itraconazole capsule, 28 male and 28 female healthy subjects were given as a single dose, 200 mg of itraconazole immediately after a moderate-fat breakfast (same caloric and fat contents as in the table above). Fifty-two subjects were included in the final analysis.

The $C_{\text{max}}$ of the TRADENAME was comparable to that of the 2 itraconazole 100-mg capsules while $AUC_t$ and $AUC_\infty$ were about 15% higher with the TRADENAME.

In another 2-period, open-label, randomized, cross-over, pivotal bioequivalence study, 28 male and 28 female healthy subjects were given one TRADENAME or two 100-mg itraconazole capsules following the FDA standard high-fat breakfast. The $C_{\text{max}}$ and $AUC_\infty$ of the TRADENAME were 20 and 30% lower, respectively, than those of two itraconazole 100-mg capsules. Overall, the inter-subject variability was high and coefficient of variances (CV) for AUCs in the above two studies were 44-66%.

Itraconazole is metabolized predominately by the cytochrome P450 3A4 isoenzyme system (CYP3A4), resulting in the formation of several metabolites. Hydroxyitraconazole, the major metabolite, has in vitro antifungal activity comparable to itraconazole. Results of a pharmacokinetics study suggest that itraconazole may undergo saturable metabolism with multiple dosing. Based on an oral dose, fecal excretion of the parent drug varies between 3-18% of the dose. Itraconazole is excreted mainly as inactive metabolites in the urine (35%) and feces (54%) within one week of an oral dose. No single excreted metabolite represents more than 5% of a dose. The plasma protein binding of itraconazole has been reported to be 99.8% and that of hydroxy-itraconazole is 99.5%. [See Contraindications (4).]

### 12.4 Microbiology

11
**Mechanism of Action**

Itraconazole inhibits the cytochrome P450-dependent synthesis of ergosterol, which is a vital component of fungal cell membranes.

**Activity In Vitro**

Itraconazole exhibits *in vitro* activity against *Trichophyton rubrum* and *Trichophyton mentagrophytes*.

**Resistance**

Isolates from several fungal species with decreased susceptibility to itraconazole have been isolated from patients receiving prolonged therapy.

Several in vitro studies have reported that some fungal clinical isolates with reduced susceptibility to one azole antifungal agent may also be less susceptible to other azole derivatives. The finding of cross-resistance is dependent on a number of factors, including the species evaluated, its clinical history, the particular azole compounds compared, and the type of susceptibility test that is performed. The relevance of these in vitro susceptibility data to clinical outcome remains to be elucidated.

**Special Populations**

**Renal Insufficiency**

Limited data are available on the use of oral itraconazole in patients with renal impairment. A pharmacokinetic study using a single 200-mg dose of itraconazole was conducted in three groups of patients with renal impairment (uremia: n=7; hemodialysis: n=7; and continuous ambulatory peritoneal dialysis: n=5). In uremic subjects with a mean creatinine clearance of 13 mL/min. x 1.73 m², the exposure, based on AUC, was slightly reduced compared with normal population parameters. The study did not demonstrate any significant effect of hemodialysis or continuous ambulatory peritoneal dialysis on the pharmacokinetics of itraconazole (T<sub>max</sub>, C<sub>max</sub>, and AUC<sub>0-8</sub>). Plasma concentration-versus-time profiles showed wide intersubject variation in all three groups. Caution should be exercised when the drug is administered in this population. [See Warnings and Precautions (5) and Dosage and Administration (2).]

**Hepatic Insufficiency**

Itraconazole is predominantly metabolized in the liver. Patients with impaired hepatic function should be carefully monitored when taking itraconazole. A pharmacokinetic study using a single oral 100 mg dose of itraconazole was conducted in 6 healthy and 12 cirrhotic subjects. A statistically significant reduction in mean C<sub>max</sub> (47%) and a twofold increase in the elimination half-life (37 ± 17 hours vs. 16 ± 5 hours) of itraconazole were noted in cirrhotic subjects compared with healthy subjects. However, overall exposure to itraconazole, based on AUC, was similar in cirrhotic patients and in healthy subjects. The prolonged elimination half-life of itraconazole observed in the single oral dose clinical trial with itraconazole in cirrhotic patients should be considered when deciding to initiate therapy with other medications metabolized by CYP3A4. Data are not available in cirrhotic patients during long-term use of itraconazole. [See Boxed Warning, Contraindications (4), Warnings and Precautions (5), and Dosage and Administration (2).]

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

No carcinogenicity, mutagenicity, or impairment of fertility studies were conducted with TRADENAME.

Itraconazole did not exhibit any carcinogenic potential in mice receiving oral doses up to 80 mg/kg/day (2 times MRHD, based on mg/m²/day comparisons) for 23 months. A slightly increased incidence of soft tissue sarcoma was observed in male rats administered 25 mg/kg/day (1.3 times MRHD, based on mg/m²/day comparisons). These tumors may have been related to hypercholesterolemia caused by chronic treatment with itraconazole in rats; hypercholesterolemia is not observed with such treatment in dogs or humans. Compared to untreated controls, female rats receiving 50 mg/kg/day (2.5 times MRHD, based on mg/m²/day comparisons) had a statistically insignificant increase in squamous cell carcinoma in lungs (2/50), an uncommon tumor in rats.

Itraconazole did not exhibit any mutagenic or genotoxic effects when evaluated in a DNA repair test (unscheduled DNA synthesis) in primary rat hepatocytes, in Ames tests (6 *Salmonella* strains and *E. coli*), in the mouse lymphoma gene mutation test, in a sex-linked recessive lethal mutation (*Drosophila melanogaster*) test, in chromosome aberration test (human lymphocytes), in a cell transformation assay (C3H/10T½ C18 mouse embryo fibroblasts), in a dominant lethal mutation test in male and female mice, and in micronucleus tests in mice and rats.

Itraconazole did not affect the fertility in male or female rats treated with oral doses up to 40 mg/kg/day (2 times MRHD, based on mg/m²/day comparisons); however, parental toxicity occurred at this dosage. More severe parental toxicity was observed at 160 mg/kg/day (10 times MRHD, based on mg/m²/day comparisons).
14 CLINICAL STUDIES
The efficacy of TRADENAME for the treatment of onychomycosis of the toenail was examined in a randomized, multi-center, placebo-controlled, third-party blinded trial comparing TRADENAME to two 100 mg itraconazole capsules and placebo tablets.

In the clinical study, 791 subjects with diagnosis of distal and/or lateral subungual onychomycosis were randomized to TRADENAME (N= 593) or placebo tablets (N= 198) once daily for 12 consecutive weeks. The median age of subjects enrolled in the trial was 48 years and 75% were males. At baseline, 95.1% of subjects had onychomycosis due to *T. rubrum* with a baseline global severity score of ‘Moderate’ which was defined as a target toenail involvement ≤50% dystrophy and/or discoloration with clear evidence of subungual hyperkeratosis and/or onycholysis.

The primary endpoint was the proportion of subjects with a Complete Cure at Week 52, nine months after completion of study medication. A Complete Cure was defined as both a Clinical Cure (no evidence of onychomycosis in target nail; normal nail unit without subungual hyperkeratosis or onycholysis) and Mycological Cure (negative KOH and negative culture). The following table illustrates the study results for TRADENAME and Placebo:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>TRADENAME N=593</th>
<th>Placebo N=198</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete Cure*</td>
<td>22.3%</td>
<td>1.0%</td>
</tr>
</tbody>
</table>

* Complete Cure defined as Clinical Cure (no evidence of onychomycosis in target nail; normal nail unit without subungual hyperkeratosis or onycholysis) and Mycological Cure (negative KOH and negative culture)

The Mycologic Cure rate was 44% and the Clinical Cure rate was 26% for subjects treated with TRADENAME. Comparatively, the Mycological Cure rate was 6% and the Clinical Cure rate was 3% for subjects treated with Placebo Tablets.

Efficacy results comparing TRADENAME to 200 mg of itraconazole capsules (two 100 mg capsules) were similar.

16 HOW SUPPLIED/STORAGE AND HANDLING
How Supplied
TRADENAME is available containing 200 mg of itraconazole, as a white to slightly grey, oblong, biconvex tablet engraved with “BARRIER” on one side and “It 200” on the other side. Each carton contains two blister cards of 14 tablets each (NDC 0145-2500-02).

Storage
Store at controlled room temperature 15° to 25°C (59° to 77°F). Excursions permitted to 15° to 30°C (59° to 86°F). Protect from light and moisture. Keep out of reach of children.

17 PATIENT COUNSELING INFORMATION
[See FDA-approved Patient Labeling.]

17.1 Information for Patients
- Instruct patients that hearing loss can occur with the use of itraconazole. The hearing loss usually resolves when treatment is stopped, but can persist in some patients. Advise patients to inform their physicians if any hearing loss occurs.
Read this Patient Information before you start using TRADENAME and each time you get a refill. There may be new information. This information does not take the place of talking with your doctor about your medical condition or treatment.

What is the most important information I should know about TRADENAME?

TRADENAME can cause serious of life-threatening side effects, including:

1. **Heart Failure.** Do not take TRADENAME if you have had heart failure, including congestive heart failure.

   **Stop taking TRADENAME and call your doctor right away if you have any of these symptoms of congestive heart failure:**

   - shortness of breath
   - swelling of your feet, ankles, or legs
   - sudden weight gain
   - increased tiredness
   - coughing up white or pink phlegm
   - fast heartbeat
   - waking up at night more than normal for you

2. **Serious cardiovascular effects.** Do not take TRADENAME if you also take the following medicines

   - cisapride (Propulsid)
   - pimozide (Orap)
   - quinidine (Quindine Gluconate, Quindine Sulfate)
   - dofetilide (Tikosyn)
   - levomethadyl (Oralaam)
   - midazolam (Versed)
   - felodipine, nisoldipine (Lexxel, Plendil, Sular)
   - triazolam (Halcion)
   - lovastatin (Mevacor, Advicor, Altoprev)
   - simvastatin (Zocor, Simcor, Vytorin)
   - ergot alkaloids (Migranal, Ergonovine, Cafergot, Methergine, Dihydroergotamine Mesylate, Methylergonovine)
   - methadone (Dolophine)

   This is not a complete list of medicines that can interact with TRADENAME.

   - Before taking TRADENAME, tell your doctor about all the medicine you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.
   - Before you start any new medicine, ask your doctor or pharmacist if it is safe to take it with TRADENAME.

What is TRADENAME?

TRADENAME is a prescription medicine used to treat fungal infections of the toenails. It is not known if TRADENAME is safe and effective in children under the age of 18.

Who should not take TRADENAME?

**Do not** take TRADENAME if you:

- have or had heart failure, including congestive heart failure.
- take certain medicines. See “What is the most important information I should know about TRADENAME?”
- are pregnant or plan to become pregnant. TRADENAME can harm your unborn baby. Talk to your doctor if you are pregnant or plan to become pregnant.
- have ever had an allergic reaction to itraconazole or any of the other ingredients in TRADENAME. Ask your doctor or pharmacist for a list of these ingredients.

What should I tell my doctor before taking TRADENAME?

Before taking TRADENAME, tell your doctor if you:

- have or had heart, lung, liver or kidney problems
- have any other medical conditions
- **are pregnant or planning to become pregnant.** See “Who should not take TRADENAME?”. Females who can become pregnant should use effective birth control during treatment with TRADENAME and for 2 months after
you stop treatment with TRADENAME. Talk to your doctor about the type of birth control that is best for you while taking TRADENAME.

- are breast-feeding or plan to breast-feed. TRADENAME can pass into your milk and may harm your baby. Talk to your doctor about the best way to feed your baby if you take TRADENAME.

Tell your doctor about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.

Taking TRADENAME with certain other medicines could lead to serious or life-threatening medical problems.

- See “What is the most important information I should know about TRADENAME?”
- Fentanyl. Taking fentanyl, a strong opioid narcotic main medicine with TRADENAME could cause serious breathing problems that can lead to death.

Talk to your doctor or pharmacist before you start any new medicine. They can tell you if it is safe to take TRADENAME with your other medicines.

Know the medicines you take. Keep a list of your medicines and show it to your doctor and pharmacist when you get a new medicine.

How should I take TRADENAME?
Take TRADENAME exactly as prescribed by your doctor. Be sure to finish all of your TRADENAME as prescribed by your doctor.

- TRADENAME comes in a 14 tablet blisterpack container.
- Take TRADENAME with a full meal.
- Your doctor should do blood tests to check your liver function before you start and while you take TRADENAME, especially if you have liver problems.
- If you forget to take or miss doses of TRADENAME, skip that dose and take the next dose at your regular time. Do not make up missed doses.
- If you take too many TRADENAME, call your local poison control center or go to the nearest hospital emergency room right away.

What are the possible side effects of TRADENAME?
TRADENAME can cause serious side effects, including:

- See “What is the most important information I should know about TRADENAME?”
- liver failure and death. Stop taking TRADENAME and call your doctor right away if you have symptoms of liver failure including:
  - unusually tired
  - lose your appetite
  - nausea
  - abdominal pain
  - vomiting
  - yellow change in the color of your skin or eyes
  - dark colored urine
  - pale stools (bowel movements)
- nerve damage (neuropathy). Call your doctor right away if you have tingling or numbness in your hands or feet. Your may need to stop taking TRADENAME if this happens.
- hearing loss. Hearing loss can happen for a short time or permanently in some people who take TRADENAME with other medications. Stop taking TRADENAME and call your doctor right away if you have any changes in your hearing.

Common side effects of TRADENAME include:

- increased liver enzyme in blood test results
- upper respiratory infection or cold (runny nose, cough and sneeze)
- urinary tract infection (burning and painful urination)
- stomach pain
- diarrhea
- nausea
- headache
- tiredness
- throat pain
- back pain
These are not all of the possible side effects of TRADENAME. Tell your doctor if you any side effect that bothers you or that
does not go away. For more information, ask your doctor.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store TRADENAME?
- Store at controlled room temperature between 59° to 77°F (15° to 25°C).
- Keep TRADENAME away from light and moisture.
- Keep TRADENAME and all medicines out of reach of children.

General Information:
Medicines are sometimes prescribed for conditions that are not mentioned in Patient Information leaflets. Do not use
TRADENAME for a condition for which it was not prescribed. Do not give TRADENAME to other people, even if they have
the same symptoms that you have. It may harm them.

This leaflet summarizes the most important information about TRADENAME. If you would like more information, talk with
your doctor. You can ask your doctor or pharmacist for information about TRADENAME that is written for health
professionals.

For more information about TRADENAME call 1-866-440-5508.

What are the ingredients in TRADENAME?
Active ingredient: itraconazole
Inactive ingredients: colloidal silicon dioxide, crospovidone, hydrogenated vegetable oil, hypromellose, lactose, magnesium
stearate, microcrystalline cellulose, propylene glycol, talc, and titanium dioxide.

The following are registered trademarks of their respective manufacturers:
Dolophine® (Roxane Laboratories, Inc), Mevacor® (Merck & Co., Inc.), Advicor® (Kos Pharmaceuticals, Inc.), Altocor™
(Andrx Laboratories), Zocor® (Merck & Co., Inc.), Halcion® (Pharmacia), Versed® (Roche Pharmaceuticals), Cardioquin® (The
Purdue Frederick Company), Quinaglute® (Berlex Laboratories), Quinidex® (A.H. Robins), TikosynTM (Pfizer, Inc.),
Propulsid® (Janssen Pharmaceutica Products, L.P.), Orlaam® (Roxane Laboratories), Migranal® (Xcel Pharmaceuticals),
Ergonovine (PDRX Pharmaceuticals), Cafergot® (Novartis Pharmaceuticals Corporation), Methergine® (Novartis
Pharmaceuticals Corporation), Orap® (Gate Pharmaceuticals), and Sular® (First Horizon Pharmaceutical Corporation)

What happens if I have a fungal nail infection?
Anyone can have a fungal nail infection, but it is usually found in adults. When a fungus infects the nail, the infected part of the
nail may turn yellow or brown. If not treated, the fungus may spread, and more of the nail may change color, may become thick
or brittle, and the tip of the nail may become raised. In some patients, this can cause pain and discomfort.
