Enalaprilat Injection, USP

Dosage and Administration

Hypertension

Hypertension may be controlled with any of the recommended dosages. Patients converting from oral to parenteral administration of enalaprilat may be started on 0.125 mg every six hours and may be titrated upward as needed based on blood pressure response. If patients require more than one additional dose increment of enalaprilat, or if greater than two doses are needed, oral therapy should be continued until the recommended dosage is obtained. The recommended oral dosage is 26 mg/day which may be given in divided doses of 13 mg every six hours.

For patients converting from oral or parenteral enalapril to enalaprilat, the starting dose is 0.125 mg every six hours. Dosing increments of 0.125 mg every six hours may be needed depending on blood pressure response. Patients converting from enalapril to enalaprilat may be started on 0.125 mg every six hours and may be titrated upward as needed based on blood pressure response. The recommended oral dosage is 26 mg/day which may be given in divided doses of 13 mg every six hours.

Dosage should then be adjusted according to blood pressure response. Patients converting from oral or parenteral enalapril to enalaprilat should be started on 0.125 mg every six hours and may be titrated upward as needed based on blood pressure response. The recommended oral dosage is 26 mg/day which may be given in divided doses of 13 mg every six hours.
