ZOMIG (zolmitriptan) tablets, for oral use
ZOMIG-ZMT (zolmitriptan), orally disintegrating tablets

Initial US Approval: 1997

Dosage and Administration (2.1, 2.3, 2.4) 09/2012

Recent Major Changes:
- Initial US Approval: 1997
- ZOMIG-ZMT (zolmitriptan), orally disintegrating tablets for ZOMIG and ZOMIG-ZMT.

Indications and Usage:
- Use only after a clear diagnosis of migraine has been established.
- Not indicated for the prophylactic therapy of migraine.
- Not indicated for the treatment of cluster headache.

DOSAGE AND ADMINISTRATION:
- Recommended starting dose: 1.25 mg or 2.5 mg.
- Maximum single dose: 5 mg.
- May repeat dose after 2 hours if needed; not to exceed 10 mg in any 24-hour period.
- Do not break ZOMIG orally disintegrating tablets.
- Moderate or Severe Hepatic Impairment: 1.25 mg recommended.

Dosage Forms and Strengths:
- Tablets: 5 mg (not scored)
- Tablets: 2.5 mg functionally-scored
- Oral Disintegrating Tablets: 2.5 mg and 5 mg

Contraindications:
- History of coronary artery disease (CAD) or coronary vasospasm.
- Symptomatic Wolff-Parkinson-White syndrome or other cardiac accessory conduction pathway disorders.
- History of stroke, transient ischemic attack, or hemiplegic or basilar migraine.

Adverse Reactions:
- Most common adverse reactions (> 5% and > placebo) were neck/throat/jaw pain/tightness/pressure, dizziness, paresthesia, asthma, somnolence, warm/cold sensation, nausea, heaviness sensation, and dry mouth.

Use in Specific Populations:
- Pregnancy: Based on animal data, may cause fetal harm.

See 17 for Patient Counseling Information and FDA-approved patient labeling.

References:
- Revised: 09/2012

*Sections or subsections omitted from the full prescribing information are not listed.
FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

ZOMIG is indicated for the acute treatment of migraine with or without aura in adults.

Limitations of Use

- Only use ZOMIG if a clear diagnosis of migraine has been established. If a patient has no response to ZOMIG treatment for the first migraine attack, reconsider the diagnosis of migraine before ZOMIG is administered to treat any subsequent attacks.
- ZOMIG is not indicated for the prevention of migraine attacks.
- Safety and effectiveness of ZOMIG have not been established for cluster headache.

2 DOSAGE AND ADMINISTRATION

2.1 Dosing Information

The recommended starting dose of ZOMIG is 1.25 mg or 2.5 mg. The 1.25 mg dose can be achieved by manually breaking the functionally-scored 2.5 mg tablet in half. The maximum recommended single dose of ZOMIG is 5 mg.

In controlled clinical trials, a greater proportion of patients had headache response following a 2.5 mg or 5 mg dose than following a 1 mg dose. There was little added benefit from the 5 mg dose compared to the 2.5 mg dose, but adverse reactions were more frequent with the 5 mg dose.

If the migraine has not resolved by 2 hours after taking ZOMIG, or returns after a transient improvement, a second dose may be administered at least 2 hours after the first dose. The maximum daily dose is 10 mg in any 24-hour period.

The safety of ZOMIG in the treatment of an average of more than three migraines in a 30-day period has not been established.

2.2 Administration of ZOMIG-ZMT Orally Disintegrating Tablets

Instruct patients not to break ZOMIG-ZMT orally disintegrating tablets because they are not functionally-scored. Administration with liquid is not necessary.
Orally disintegrating tablets are packaged in a blister pack. Instruct patients not to remove the tablet from the blister until just prior to dosing. Subsequently, instruct patients to peel the blister pack open, and to place the orally disintegrating tablet on the tongue, where it will dissolve and it will be swallowed with the saliva.

2.3 Dosing in Patients with Hepatic Impairment

The recommended dose of ZOMIG in patients with moderate to severe hepatic impairment is 1.25 mg (one-half of one 2.5 mg ZOMIG tablet) because of increased zolmitriptan blood levels in these patients and elevation of blood pressure in some of these patients. Limit the total daily dose in patients with severe hepatic impairment to no more than 5 mg per day.

The use of ZOMIG-ZMT orally disintegrating tablets is not recommended in patients with moderate or severe hepatic impairment because these orally disintegrating tablets should not be broken in half [see Use in Specific Populations (8.6), and Clinical Pharmacology (12.3)].

2.4 Dosing in Patients taking Cimetidine

If ZOMIG is co-administered with cimetidine, limit the maximum single dose of ZOMIG to 2.5 mg, not to exceed 5 mg in any 24-hour period [see Drug Interactions (7.5), Clinical Pharmacology (12.3)].

3 DOSAGE FORMS AND STRENGTHS

2.5 mg Tablets: Yellow, biconvex, round, film-coated identified with “ZOMIG” and “2.5” debossed on one side (functionally-scored).

5 mg Tablets: Pink, biconvex, round, film-coated identified with “ZOMIG” and “5” debossed on one side (not scored).

2.5 Orally Disintegrating Tablets: White, flat-faced, round, uncoated, bevelled identified with a debossed “Z” on one side.

5 mg Orally Disintegrating Tablets: White, flat-faced, round, uncoated, bevelled identified with a debossed “Z” and “5” on one side.

4 CONTRAINDICATIONS

ZOMIG is contraindicated in patients with:

- Ischemic coronary artery disease (angina pectoris, history of myocardial infarction, or documented silent ischemia), other significant underlying cardiovascular disease, or coronary artery vasospasm including Prinzmetal’s angina [see Warnings and Precautions (5.1)]
- Wolff-Parkinson-White Syndrome or arrhythmias associated with other cardiac accessory conduction pathway disorders [see Warnings and Precautions (5.2)]
- History of stroke, transient ischemic attack (TIA), or history of hemiplegic or basilar migraine because these patients are at a higher risk of stroke [see Warnings and Precautions (5.4)]
- Peripheral vascular disease (PVD) [see Warnings and Precautions (5.5)]
- Ischemic bowel disease [see Warnings and Precautions (5.5)]
- Uncontrolled hypertension [see Warnings and Precautions (5.8)]
- Recent use (i.e., within 24 hours) of another 5-HT\textsubscript{1} agonist, ergotamine-containing medication, or ergot-type medication (such as dihydroergotamine or methysergide) [see Drug Interactions (7.1, 7.3)]
- Concurrent administration of a monoamine oxidase (MAO)-A inhibitor or recent use of a MAO-A inhibitor (that is within 2 weeks) [see Drug Interactions (7.2) and Clinical Pharmacology (12.3)]
- Known hypersensitivity to ZOMIG or ZOMIG ZMT (angioedema and anaphylaxis seen) [see Adverse Reactions (6.2)]

5 WARNINGS AND PRECAUTIONS

5.1 Myocardial Ischemia, Myocardial Infarction, and Prinzmetal Angina
ZOMIG is contraindicated in patients with ischemic or vasospastic coronary artery disease (CAD). There have been rare reports of serious cardiac adverse reactions, including acute myocardial infarction, occurring within a few hours following administration of ZOMIG. Some of these reactions occurred in patients without known CAD. 5-HT\textsubscript{1} agonists including ZOMIG may cause coronary artery vasospasm (Prinzmetal Angina), even in patients without a history of CAD.

Perform a cardiovascular evaluation in triptan-naïve patients who have multiple cardiovascular risk factors (e.g., increased age, diabetes, hypertension, smoking, obesity, strong family history of CAD) prior to receiving ZOMIG. Do not administer ZOMIG if there is evidence of CAD or coronary artery vasospasm [see Contraindications (4)]. For patients with multiple cardiovascular risk factors who have a negative cardiovascular evaluation, consider administrating the first ZOMIG dose in a medically-supervised setting and
performing an electrocardiogram (ECG) immediately following ZOMIG administration. For such patients, consider periodic cardiovascular evaluation in intermittent long-term users of ZOMIG.

5.2 **Arrhythmias**
Life-threatening disturbances of cardiac rhythm including ventricular tachycardia and ventricular fibrillation leading to death have been reported within a few hours following the administration of 5-HT₁ agonists. Discontinue ZOMIG if these disturbances occur. ZOMIG is contraindicated in patients with Wolff-Parkinson-White Syndrome or arrhythmias associated with other cardiac accessory conduction pathway disorders [see Contraindications (4)].

5.3 **Chest, Throat, Neck and Jaw Pain/Tightness/Pressure**
As with other 5-HT₁ agonists, sensations of tightness, pain, and pressure in the chest, throat, neck, and jaw commonly occur after treatment with ZOMIG and is usually non-cardiac in origin. However, perform a cardiac evaluation if these patients are at high cardiac risk. 5-HT₁ agonists including ZOMIG are contraindicated in patients with CAD or Prinzmetal’s variant angina [see Contraindications (4)].

5.4 **Cerebrovascular Events**
Cerebral hemorrhage, subarachnoid hemorrhage, and stroke have occurred in patients treated with 5-HT₁ agonists, and some have resulted in fatalities. In a number of cases, it appears possible that the cerebrovascular events were primary, the 5-HT₁ agonist having been administered in the incorrect belief that the symptoms experienced were a consequence of migraine, when they were not.

As with other acute migraine therapies, before treating headaches in patients not previously diagnosed as migraineurs, and in migraineurs who present with symptoms atypical for migraine, exclude other potentially serious neurological conditions. ZOMIG is contraindicated in patients with a history of stroke or transient ischemic attack [see Contraindications (4)].

5.5 **Other Vasospasm Reactions**
5-HT₁ agonists, including ZOMIG, may cause non-coronary vasospastic reactions, such as peripheral vascular ischemia, gastrointestinal vascular ischemia and infarction (presenting with abdominal pain and bloody diarrhea), splenic infarction, and Raynaud’s syndrome. In patients who experience symptoms or signs suggestive of a vasospastic reaction following the use of any 5-HT₁ agonist, rule out a vasospastic
reaction before receiving additional ZOMIG doses [see Contraindications (4)].

Reports of transient and permanent blindness and significant partial vision loss have been reported with the use of 5-HT\textsubscript{1} agonists. Since visual disorders may be part of a migraine attack, a causal relationship between these events and the use of 5-HT\textsubscript{1} agonists have not been clearly established.

5.6 Medication Overuse Headache
Overuse of acute migraine drugs (e.g. ergotamine, triptans, opioids, or a combination of drugs for 10 or more days per month) may lead to exacerbation of headache (medication overuse headache). Medication overuse headache may present as migraine-like daily headaches or as a marked increase in frequency of migraine attacks. Detoxification of patients, including withdrawal of the overused drugs, and treatment of withdrawal symptoms (which often includes a transient worsening of headache) may be necessary.

5.7 Serotonin Syndrome
Serotonin syndrome may occur with triptans, including ZOMIG, particularly during co-administration with selective serotonin reuptake inhibitors (SSRIs), serotonin norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), and MAO inhibitors [see Drug Interactions (7.5)]. Serotonin syndrome symptoms may include mental status changes (e.g., agitation, hallucinations, coma), autonomic instability (e.g., tachycardia, labile blood pressure, hyperthermia), neuromuscular aberrations (e.g., hyperreflexia, incoordination), and/or gastrointestinal symptoms (e.g., nausea, vomiting, diarrhea). The onset of symptoms usually rapidly occurs within minutes to hours of receiving a new or a greater dose of a serotonergic medication. Discontinue ZOMIG if serotonin syndrome is suspected [see Drug Interactions (7.4)].

5.8 Increase in Blood Pressure
Significant elevations in systemic blood pressure have been reported in patients treated with 5-HT\textsubscript{1} agonists including patients without a history of hypertension; very rarely, these increases in blood pressure have been associated with serious adverse reactions. In healthy subjects treated with 5 mg of ZOMIG, an increase of 1 and 5 mm Hg in the systolic and diastolic blood pressure, respectively, was seen. In a study of patients with moderate to severe liver impairment, 7 of 27 patients experienced 20 to 80 mm Hg elevations in systolic and/or diastolic blood pressure after a dose of 10 mg of ZOMIG.
As with all triptans, blood pressure should be monitored in ZOMIG-treated patients. ZOMIG is contraindicated in patients with uncontrolled hypertension [see Contraindications (4)].

5.9 Risks in Patients with Phenylketonuria
Phenylalanine can be harmful to patients with phenylketonuria (PKU). ZOMIG-ZMT orally disintegrating tablets contain phenylalanine (a component of aspartame). Each 2.5 mg and 5 mg orally disintegrating tablet contains 2.81 and 5.62 mg of phenylalanine, respectively. ZOMIG tablets do not contain phenylalanine.

6 ADVERSE REACTIONS
The following adverse reactions are described elsewhere in other sections of the prescribing information:

- Myocardial Ischemia, Myocardial Infarction, and Prinzmetal Angina [see Warnings and Precautions (5.1)].
- Arrhythmias [see Warnings and Precautions (5.2)].
- Chest and or Throat, Neck and Jaw Pain/Tightness/Pressure [see Warnings and Precautions (5.3)].
- Cerebrovascular Events [see Warnings and Precautions (5.4)].
- Other Vasospasm Reactions [see Warnings and Precautions (5.5)].
- Medication Overuse Headache [see Warnings and Precautions (5.6)].
- Serotonin Syndrome [see Warnings and Precautions (5.7)].
- Increase in Blood Pressure [see Warnings and Precautions (5.8)].
- Risks in Patients with Phenylketonuria [see Warnings and Precautions (5.9)].

6.1 Clinical Trials Experience
Because clinical studies are conducted under widely varying conditions, adverse reaction rates observed in the clinical studies of a drug cannot be directly compared to rates in the clinical studies of another drug and may not reflect the rates observed in practice.

In a long-term, open-label study where patients were allowed to treat multiple migraine attacks for up to 1 year, 8% (167 out of 2,058) withdrew from the trial because of adverse reaction.
The most common adverse reactions (≥ 5% and > placebo) in these trials were neck/throat/jaw pain, dizziness, paresthesia, asthenia, somnolence, warm/cold sensation, nausea, heaviness sensation, and dry mouth.

Table 1 lists the adverse reactions that occurred in ≥ 2% of the 2,074 patients in any one of the ZOMIG 1 mg, 2.5 mg, or 5 mg dose groups in the controlled clinical trials of ZOMIG in patients with migraines (Studies 1, 2, 3, 4, and 5) [see Clinical Studies (14)]. Only adverse reactions that were at least 2% more frequent in a ZOMIG group compared to the placebo group are included.

Several of the adverse reactions appear dose related, notably paresthesia, sensation of heaviness or tightness in chest, neck, jaw, and throat, dizziness, somnolence and possibly asthenia and nausea.

Reference ID: 3186822
There were no differences in the incidence of adverse reactions in controlled clinical trials in the following subgroups: gender, weight, age, use of prophylactic medications, or presence of aura. There were insufficient data to assess the impact of race on the incidence of adverse reactions.

**Less Common Adverse Reactions with ZOMIG Tablets:**
In the paragraphs that follow, the frequencies of less commonly reported adverse clinical reactions are presented. Because the reports include reactions observed in open and uncontrolled studies, the role of ZOMIG in their causation cannot be reliably determined. Furthermore, variability associated with adverse reaction reporting, the terminology used to describe adverse reactions, etc., limit the value of the quantitative frequency estimates provided. Adverse reaction frequencies were calculated as the number of patients who used ZOMIG tablets and reported a reaction divided by the total number of patients exposed to ZOMIG tablets (n=4,027). Reactions were further classified within body system categories and enumerated in order of decreasing frequency using the following definitions: infrequent adverse reactions (those occurring in 1/100 to 1/1,000 patients) and rare adverse reactions (those occurring in less than 1/1,000 patients).

**General:** Infrequent were allergic reactions.
**Cardiovascular:** Infrequent were arrhythmias, hypertension, and syncope. Rare was tachycardia.
**Neurological:** Infrequent were agitation, anxiety, depression, emotional lability and insomnia; Rare were amnesia, hallucinations, and cerebral ischemia.
**Skin:** Infrequent were pruritus, rash and urticaria.
**Urogenital:** Infrequent were polyuria, urinary frequency and urinary urgency.

**Adverse Reactions with ZOMIG-ZMT Oral Disintegrating Tablets**
The adverse reaction profile seen with ZOMIG-ZMT oral disintegrating tablets was similar to that seen with ZOMIG tablets.
6.2 Postmarketing Experience
The following adverse reactions were identified during post approval use of ZOMIG. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

The reactions enumerated include all except those already listed in the Clinical Trials Experience section above or the Warnings and Precautions section.

Hypersensitivity Reactions:
As with other 5-HT\(_{1B/1D}\) agonists, there have been reports of anaphylaxis, anaphylactoid, and hypersensitivity reactions including angioedema in patients receiving ZOMIG. ZOMIG is contraindicated in patients with a history of hypersensitivity reaction to ZOMIG.

7 DRUG INTERACTIONS

7.1 Ergot-containing Drugs
Ergot-containing drugs have been reported to cause prolonged vasospastic reactions. Because these effects may be additive, use of ergotamine-containing or ergot-type medications (like dihydroergotamine or methysergide) and ZOMIG within 24 hours of each other is contraindicated [see Contraindications (4)].

7.2 MAO-A Inhibitors
MAO-A inhibitors increase the systemic exposure of zolmitriptan and its active N-desmethyl metabolite. Therefore, the use of ZOMIG in patients receiving MAO-A inhibitors is contraindicated [see Contraindications (4) and Clinical Pharmacology (12.3)].

7.3 5-HT\(_{1B/1D}\) agonists
Concomitant use of other 5-HT\(_{1B/1D}\) agonists (including triptans) within 24 hours of ZOMIG treatment is contraindicated because the risk of vasospastic reactions may be additive [see Contraindications (4)].

7.4 Selective Serotonin Reuptake Inhibitors and Serotonin Norepinephrine Reuptake Inhibitors
Cases of life-threatening serotonin syndrome have been reported during co-administration of triptans and selective serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs) [see Warnings and Precautions (5.7)].
7.5 **Cimetidine**
Following administration of cimetidine, the half-life and blood levels of zolmitriptan and its active N-desmethyl metabolite were approximately doubled [see *Clinical Pharmacology (12.3)*]. If cimetidine and ZOMIG are used concomitantly, limit the maximum single dose of ZOMIG to 2.5 mg, not to exceed 5 mg in any 24-hour period [see *Dosage and Administration, (2.4)*and *Clinical Pharmacology (12.3)*].

8 **USE IN SPECIFIC POPULATIONS**

8.1 **Pregnancy**
Pregnancy Category C: There are no adequate and well-controlled studies in pregnant women; therefore, ZOMIG should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. In reproductive toxicity studies in rats and rabbits, oral administration of zolmitriptan to pregnant animals resulted in embryolethality and fetal abnormalities (malformations and variations) at clinically relevant exposures.

When zolmitriptan was administered to pregnant rats during the period of organogenesis at oral doses of 100, 400, and 1200 mg/kg/day (plasma exposures (AUCs) ≈280, 1100, and 5000 times the human AUC at the maximum recommended human dose (MRHD) of 10 mg/day), there was a dose-related increase in embryolethality. A no-effect dose for embryolethality was not established. When zolmitriptan was administered to pregnant rabbits during the period of organogenesis at oral doses of 3, 10, and 30 mg/kg/day (plasma AUCs ≈1, 11, and 42 times the human AUC at the MRHD), there were increases in embryolethality and in fetal malformations and variations. The no-effect dose for adverse effects on embryo-fetal development was associated with a plasma AUC similar to that in humans at the MRHD. When female rats were given zolmitriptan during gestation, parturition, and lactation at oral doses of 25, 100, and 400 mg/kg/day (plasma AUCs ≈70, 280, and 1100 times that in human at the MRHD), an increased incidence of hydronephrosis was found in the offspring. The no-effect dose was associated with a plasma AUC ≈280 times that in humans at the MRHD.

8.3 **Nursing Mothers**
It is not known whether zolmitriptan is excreted in human milk. Because many drugs are excreted in human milk, and because of the potential for serious adverse reactions in nursing infants from ZOMIG, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.
In rats, oral dosing with zolmitriptan resulted in levels in milk up to 4 times higher than in plasma.

**8.4 Pediatric Use**

The safety and effectiveness in pediatric patients have not been established. Therefore, ZOMIG is not recommended for use in patients under 18 years of age.

One randomized, placebo-controlled clinical trial of ZOMIG tablets (2.5, 5 and 10 mg) evaluated 696 pediatric patients (aged 12-17 years) with migraines. This study did not demonstrate the efficacy of ZOMIG compared to placebo in the treatment of migraine in adolescents. Adverse reactions in the adolescent patients treated with ZOMIG were similar in nature and frequency to those reported in clinical trials in adults treated with ZOMIG. ZOMIG has not been studied in pediatric patients less than 12 years old.

In the postmarketing experience with triptans, including ZOMIG, there were no additional adverse reactions seen in pediatric patients that were not seen in adults.

**8.5 Geriatric Use**

Clinical studies of ZOMIG did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

A cardiovascular evaluation is recommended for geriatric patients who have other cardiovascular risk factors (e.g., diabetes, hypertension, smoking, obesity, strong family history of coronary artery disease) prior to receiving ZOMIG [see *Warnings and Precautions (5.1)*].

The pharmacokinetics of zolmitriptan were similar in geriatric patients (aged > 65 years) compared to younger patients [see *Clinical Pharmacology (12.3)*].
8.6 Patients with Hepatic Impairment:
After oral ZOMIG administration, zolmitriptan blood levels were increased in patients with moderate to severe hepatic impairment, and significant elevation in blood pressure was observed in some of these patients [see Warnings and Precautions (5.8)]. Therefore, adjust the ZOMIG dose and administer with caution in patients with moderate or severe hepatic impairment [see Dosage and Administration (2.3) and Clinical Pharmacology (12.3)].

10 OVERDOSAGE

There is no experience with acute overdose of ZOMIG. Clinical study subjects who received single 50 mg oral doses of ZOMIG commonly experienced sedation.

There is no specific antidote to ZOMIG. In cases of severe intoxication, intensive care procedures are recommended, including establishing and maintaining a patent airway, ensuring adequate oxygenation and ventilation, and monitoring and support of the cardiovascular system.

The elimination half-life of ZOMIG is 3 hours [see Clinical Pharmacology (12.1)]; therefore, monitor patients after overdose with ZOMIG for at least 15 hours or until symptoms or signs resolve. It is unknown what effect hemodialysis or peritoneal dialysis has on the plasma concentrations of zolmitriptan.

11 DESCRIPTION
ZOMIG® (zolmitriptan) tablets and ZOMIG-ZMT® (zolmitriptan) orally disintegrating tablets contain zolmitriptan, which is a selective 5-hydroxytryptamine<sub>1B/1D</sub> (5-HT<sub>1B/1D</sub>) receptor agonist. Zolmitriptan is chemically designated as (S)-4-[[3-[2-(dimethylamino)ethyl]-1H-indol-5-yl]methyl]-2-oxazolidinone and has the following chemical structure:
The empirical formula is \( \text{C}_{16}\text{H}_{21}\text{N}_{3}\text{O}_{2} \), representing a molecular weight of 287.36. Zolmitriptan is a white to almost white powder that is readily soluble in water.

ZOMIG tablets are available as 2.5 mg (yellow and functionally-score) and 5 mg (pink, not scored) film coated tablets for oral administration. The film coated tablets contain anhydrous lactose NF, microcrystalline cellulose NF, sodium starch glycolate NF, magnesium stearate NF, hydroxypropyl methylcellulose USP, titanium dioxide USP, polyethylene glycol 400 NF, yellow iron oxide NF (2.5 mg tablet), red iron oxide NF (5 mg tablet), and polyethylene glycol 8000 NF.

ZOMIG-ZMT® orally disintegrating tablets are available as 2.5 mg and 5 mg white uncoated tablets. The orally disintegrating tablets contain mannitol USP, microcrystalline cellulose NF, crospovidone NF, aspartame NF [see Warnings and Precautions (5.9)], sodium bicarbonate USP, citric acid anhydrous USP, colloidal silicon dioxide NF, magnesium stearate NF and orange flavor SN 027512.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Zolmitriptan binds with high affinity to human recombinant 5-HT\textsubscript{1D} and 5-HT\textsubscript{1B} receptors, and moderate affinity for 5-HT\textsubscript{1A} receptors. The N-desmethyl metabolite also has high affinity for 5-HT\textsubscript{1B/1D} and moderate affinity for 5-HT\textsubscript{1A} receptors.

Migraines are likely due to local cranial vasodilatation and/or to the release of sensory neuropeptides (vasoactive intestinal peptide, substance P and calcitonin gene-related peptide) through nerve endings in the trigeminal system. The therapeutic activity of ZOMIG for the treatment of migraine headache is thought to be due to the agonist effects at the 5-HT\textsubscript{1B/1D} receptors on intracranial blood vessels (including the arterio-venous anastomoses) and sensory nerves of the trigeminal system which result in cranial vessel constriction and inhibition of pro-inflammatory neuropeptide release.

12.3 Pharmacokinetics

Absorption, Distribution, Metabolism, and Excretion

Absorption

Zolmitriptan is well absorbed after oral administration for both ZOMIG tablets and the ZOMIG-ZMT orally disintegrating tablets. Zolmitriptan displays linear kinetics over the dose range of 2.5 to 50 mg.
The AUC and $C_{\text{max}}$ of zolmitriptan are similar following administration of ZOMIG tablets and ZOMIG-ZMT orally disintegrating tablets, but the $T_{\text{max}}$ is somewhat later with ZOMIG-ZMT, with a median $T_{\text{max}}$ of 3 hours for ZOMIG-ZMT orally disintegrating tablet compared with 1.5 hours for the ZOMIG tablet. The AUC, $C_{\text{max}}$, and $T_{\text{max}}$ for the active N-desmethyl metabolite are similar for the two formulations.

During a moderate to severe migraine attack, mean AUC$_{0-4}$ and $C_{\text{max}}$ for zolmitriptan, dosed as a ZOMIG tablet, were decreased by 40% and 25%, respectively, and mean $T_{\text{max}}$ was delayed by one-half hour compared to the same patients during a migraine free period.

Food has no significant effect on the bioavailability of zolmitriptan. No accumulation occurred on multiple dosing.

**Distribution**
Mean absolute bioavailability is approximately 40%. The mean apparent volume of distribution is 7.0 L/kg. Plasma protein binding of zolmitriptan is 25% over the concentration range of 10-1000 ng/mL.

**Metabolism**
Zolmitriptan is converted to an active N-desmethyl metabolite; the metabolite concentrations are about two-thirds that of zolmitriptan. Because the 5HT$_{1B/1D}$ potency of the metabolite is 2 to 6 times that of the parent compound, the metabolite may contribute a substantial portion of the overall effect after ZOMIG administration.

**Excretion**
Total radioactivity recovered in urine and feces was 65% and 30% of the administered dose, respectively. About 8% of the dose was recovered in the urine as unchanged zolmitriptan. Indole acetic acid metabolite accounted for 31% of the dose, followed by N-oxide (7%) and N-desmethyl (4%) metabolites. The indole acetic acid and N-oxide metabolites are inactive.

Mean total plasma clearance is 31.5 mL/min/kg, of which one-sixth is renal clearance. The renal clearance is greater than the glomerular filtration rate suggesting renal tubular secretion.

**Special Populations**

**Hepatic Impairment**
In patients with severe hepatic impairment, the mean Cmax, Tmax, and AUC0-∞ of zolmitriptan were increased 1.5-fold, 2-fold (2 vs. 4 hours), and 3-fold, respectively, compared to subjects with normal hepatic function. Seven out of 27 patients experienced 20 to 80 mm Hg elevations in systolic and/or diastolic blood pressure after a 10 mg ZOMIG dose. Adjust the ZOMIG Dose in patients with moderate or severe hepatic impairment [see Dosage and Administration (2.3) and Use in Specific Populations (8.6)].

**Renal Impairment**
Clearance of zolmitriptan was reduced by 25% in patients with severe renal impairment (Clcr ≥ 5 ≤ 25 mL/min) compared to subjects with normal renal function (Clcr ≥ 70 mL/min); no significant change in clearance was observed in patients with moderate renal impairment (Clcr ≥ 26 ≤ 50 mL/min).

**Age**
Zolmitriptan pharmacokinetics in healthy elderly non-migraineur volunteers (age 65–76 years) was similar to those in younger non-migraineur volunteers (age 18 - 39 years).

**Sex**
Mean plasma concentrations of zolmitriptan were up to 1.5-fold higher in females than males.

**Race**
Retrospective analysis of pharmacokinetic data between Japanese and Caucasians revealed no significant differences.

**Hypertensive Patients**
No differences in the pharmacokinetics of zolmitriptan or its effects on blood pressure were seen in mild to moderate hypertensive volunteers compared with normotensive controls.

**Drug Interaction Studies**
All drug interaction studies were performed in healthy volunteers using a single 10 mg dose of ZOMIG and a single dose of the other drug except where otherwise noted.

**MAO Inhibitors**
Following one week of administration of moclobemide (150 mg twice daily), a specific MAO-A inhibitor, there was an increase of about 25% in both Cmax and AUC for zolmitriptan and a 3-fold increase in the Cmax and AUC of the active N-desmethyl metabolite of zolmitriptan. MAO inhibitors are contraindicated in ZOMIG-treated patients [see
Selegiline, a selective MAO-B inhibitor, at a dose of 10 mg/day for 1 week, had no effect on the pharmacokinetics of zolmitriptan and its metabolite.

**Cimetidine**
Following the administration of cimetidine, the half-life and AUC of zolmitriptan (5 mg dose), and its active metabolite, were approximately doubled [see Dosage and Administration (2.4), Drug Interactions (7.5)].

**Fluoxetine**
The pharmacokinetics of zolmitriptan, as well as its effect on blood pressure, were unaffected by 4 weeks of pretreatment with oral fluoxetine (20 mg/day).

**Propranolol**
C$_{\text{max}}$ and AUC of zolmitriptan were increased 1.5-fold after one week of dosing with propranolol (160 mg/day). C$_{\text{max}}$ and AUC of the N-desmethyl metabolite were reduced by 30% and 15%, respectively. There were no changes in blood pressure or pulse rate following administration of propranolol with ZOMIG.

**Acetaminophen**
A single 1 gram dose of acetaminophen did not alter the pharmacokinetics of zolmitriptan and its N-desmethyl metabolite. However, ZOMIG administration delayed the T$_{\text{max}}$ of acetaminophen by one hour.

**Metoclopramide**
A single 10 mg dose of metoclopramide had no effect on the pharmacokinetics of zolmitriptan or its metabolites.

**Oral Contraceptives**
Retrospective analysis of pharmacokinetic data across studies indicated that mean C$_{\text{max}}$ and AUC of zolmitriptan were increased by 30% and 50%, respectively, and T$_{\text{max}}$ was delayed by one-half hour in women taking oral contraceptives. The effect of ZOMIG on the pharmacokinetics of oral contraceptives has not been studied.

13 **NONCLINICAL TOXICOLOGY**

13.1 **Carcinogenesis, Mutagenesis, Impairment of Fertility**

**Carcinogenesis**
Zolmitriptan was administered to mice and rats at doses up to 400 mg/kg/day. Mice were dosed for 85 weeks (males) and...
92 weeks (females); rats were dosed for 101 weeks (males) and 86 weeks (females). There was no evidence of drug-induced tumors in mice at plasma exposures (AUC) up to approximately 700 times that in humans at the maximum recommended human dose (MRHD) of 10 mg/day. In rats, there was an increase in the incidence of thyroid follicular cell hyperplasia and thyroid follicular cell adenomas in male rats receiving 400 mg/kg/day. No increase in tumors was observed in rats at 100 mg/kg/day, a dose associated with a plasma AUC approximately 700 times that in humans at the MRHD.

**Mutagenesis**

Zolmitriptan was positive in an *in vitro* bacterial reverse mutation (Ames) assay and in an *in vitro* chromosomal aberration assay in human lymphocytes. Zolmitriptan was negative in an *in vitro* mammalian gene cell mutation (CHO/HGPRT) assay and in oral *in vivo* mouse micronucleus assays in mouse and rat.

**Impairment of Fertility**

Studies of male and female rats administered zolmitriptan prior to and during mating and up to implantation showed no impairment of fertility at oral doses up to 400 mg/kg/day. The plasma exposure (AUC) at this dose was approximately 3000 times that in humans at the MRHD.

**14 CLINICAL STUDIES**

**ZOMIG Tablets**

The efficacy of ZOMIG tablets in the acute treatment of migraine headaches was demonstrated in five randomized, double-blind, placebo-controlled studies (Studies 1, 2, 3, 4, and 5), of which two utilized the 1 mg dose, two utilized the 2.5 mg dose and four utilized the 5 mg dose. In Study 1, patients treated their headaches in a clinic setting. In the other studies, patients treated their headaches as outpatients. In Study 4, patients who had previously used sumatriptan were excluded, whereas in the other studies no such exclusion was applied.

Patients enrolled in these 5 studies were predominantly female (82%) and Caucasian (97%) with a mean age of 40 years (range 12-65). Patients were instructed to treat a moderate to severe headache. Headache response, defined as a reduction in headache severity from moderate or severe pain to mild or no pain, was assessed at 1, 2, and, in most studies, 4 hours after dosing. Associated symptoms such as nausea, photophobia, and phonophobia were also assessed. Maintenance of response was assessed for up to 24 hours post-dose. A second dose of ZOMIG tablets or other medication was allowed 2 to
24 hours after the initial treatment for persistent and recurrent headache. The frequency and time to use of these additional treatments were also recorded. In all studies, the effect of ZOMIG was compared to placebo in the treatment of a single migraine attack.

In all five studies, the percentage of patients achieving headache response 2 hours after treatment was significantly greater among patients who received ZOMIG tablets at all doses (except for the 1 mg dose in the smallest study) compared to those who received placebo. In Studies 1 and 3, there was a statistically significant greater percentage of patients with headache response at 2 hours in the higher dose groups (2.5 and/or 5 mg) compared to the 1 mg dose group. There were no statistically significant differences between the 2.5 and 5 mg dose groups (or of doses up to 20 mg) for the primary end point of headache response at 2 hours in any study. The results of these controlled clinical studies are summarized in Table 1.

**Table 2** Percentage of Patients with Headache Response (Reduction in Headache Severity from Moderate or Severe Pain to Mild or No Headache) 2 Hours Following Treatment in Studies 1 through 5

Reference ID: 3186822
The estimated probability of achieving an initial headache response by 4 hours following treatment in pooled Studies 2, 3, and 5 is depicted in Figure 1.

Figure 1  
Estimated Probability of Achieving Initial Headache Response (Reduction in Headache Severity from Moderate or Severe Pain to Mild or No Headache) Within 4 Hours of Treatment in Pooled Studies 2, 3, and 5*

*In this Kaplan-Meier plot, the averages displayed are based on pooled data from 3 placebo controlled, outpatient trials. Patients not achieving headache response or taking additional treatment prior to 4 hours were censored at 4 hours.

For patients with migraine associated photophobia, phonophobia, and nausea at baseline, there was a decreased incidence of these symptoms following administration of ZOMIG tablets as compared with placebo.

Two to 24 hours following the initial dose of study treatment, patients were allowed to use additional treatment for pain relief in the form of a second dose of study treatment or other medication. The estimated probability of patients taking a second dose or other medication for migraine over the 24 hours following the initial dose of study treatment is summarized in Figure 2.
The efficacy of ZOMIG was unaffected by presence of aura; duration of headache prior to treatment; relationship to menses; gender, age, or weight of the patient; pre-treatment nausea or concomitant use of common migraine prophylactic drugs.

**ZOMIG-ZMT Orally Disintegrating Tablets**

The efficacy of ZOMIG-ZMT 2.5 mg orally disintegrating tablets was demonstrated in a randomized, placebo-controlled trial (Study 6) that was similar in design to the trials of ZOMIG tablets. Patients were instructed to treat a moderate to severe headache. Of the 471 patients treated in Study 6, 87% were female and 97% were Caucasian, with a mean age of 41 years (range 18-62).

At 2 hours post-dosing, there was a statistically significant greater percentage of patients treated with ZOMIG-ZMT 2.5 mg with a headache response (reduction in headache severity from moderate or severe pain to mild or no headache) compared to patients treated with placebo (63% vs. 22%). The estimated probability of achieving an initial headache response by 2 hours following treatment with ZOMIG-ZMT orally disintegrating tablets is depicted in Figure 3.
Figure 3  Estimated Probability of Achieving Initial Headache Response (Reduction in Headache Severity from Moderate or Severe Pain to Mild or No Headache) Within 2 Hours in Study 6*

*In this Kaplan-Meier plot, patients taking additional treatment or not achieving headache response prior to 2 hours were censored at 2 hours.

For patients with migraine-associated photophobia, phonophobia and nausea at baseline, there was a decreased incidence of these symptoms following administration of ZOMIG-ZMT as compared to placebo.

Two to 24 hours following the initial dose of study treatment, patients were allowed to use additional treatment in the form of a second dose of study treatment or other medication. The estimated probability of patients taking a second dose or other medication for migraine over the 24 hours following the initial dose of study treatment in Study 6 is summarized in Figure 4.

Figure 4  The Estimated Probability of Patients Taking a Second Dose or Other Medication for Migraines Over the 24 Hours Following The Initial Dose of Study Treatment in Study 6*

* In this Kaplan-Meier plot, patients not taking additional treatments were censored at 24 hours. The plot includes both patients who had headache response at 2 hours and those who had no response to the initial dose. Taking another dose of study medication was allowed 2 hours post-dose in Study 6. In contrast to studies of ZOMIG tablets (Studies 1, 2, 3, 4, and 5),
Study 6 allowed re-dosing of ZOMIG-ZMT oral disintegrating tablets prior to 4 hours.

16 HOW SUPPLIED/STORAGE AND HANDLING

2.5 mg Tablets - Yellow, biconvex, round, film-coated, functionally-scored tablets containing 2.5 mg of zolmitriptan identified with “ZOMIG” and “2.5” debossed on one side are supplied in cartons containing a blister pack of 6 tablets (NDC 64896-671-51).

5 mg Tablets – Pink, biconvex, round, film-coated tablets containing 5 mg of zolmitriptan identified with “ZOMIG” and “5” debossed on one side are supplied in cartons containing a blister pack of 3 tablets (NDC 64896-672-50).

2.5 mg Orally Disintegrating Tablets - White, flat-faced, round, uncoated, bevelled tablet containing 2.5 mg of zolmitriptan identified with a debossed “Z” on one side are supplied in cartons containing a blister pack of 6 orally disintegrating tablets (NDC 64896-691-51).

5 mg Orally Disintegrating Tablets - White, flat-faced, round, uncoated, bevelled tablet containing 5 mg of zolmitriptan identified with a debossed “Z” and “5” on one side and plain on the other are supplied in cartons containing a blister pack of 3 orally disintegrating tablets (NDC 64896-692-50).

Store ZOMIG Tablets and ZOMIG-ZMT Tablets at controlled room temperature, 20-25°C (68-77°F) [see USP]. Protect from light and moisture.

17 PATIENT COUNSELING INFORMATION

See FDA Approved Patient Labeling (Patient Information).

Myocardial Ischemia and/or Infarction, Prinzmetal’s angina, Other Vasospastic Reactions, and Cerebrovascular Events
Inform patients that ZOMIG may cause serious cardiovascular adverse reactions such as myocardial infarction or stroke, which may result in hospitalization and even death. Although serious cardiovascular reactions can occur without warning symptoms, instruct patients to be alert for the signs and symptoms of chest pain, shortness of breath, weakness, slurring of speech, and instruct them to ask for medical advice when observing any indicative sign or symptoms. Instruct patients to seek medical advice if they have symptoms of other vasospastic reactions [see Warnings and Precautions (5.1, 5.2, 5.4, 5.5)].

**Medication Overuse Headache**
Inform patients that use of drugs to treat acute migraines for 10 or more days per month may lead to an exacerbation of headache, and encourage patients to record headache frequency and drug use (e.g., by keeping a headache diary) [see Warnings and Precautions (5.6)].

**Serotonin Syndrome**
Inform patients about the risk of serotonin syndrome with the use of ZOMIG or other triptans, particularly during combined use with selective serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs) [see Warnings and Precautions (5.7)].

**Pregnancy**
Inform patients that ZOMIG should not be used during pregnancy unless the potential benefit justifies the potential risk to the fetus [see Use in Specific Populations (8.1)].

**Nursing Mothers**
Advise patients to notify their healthcare provider if they are breastfeeding or plan to breastfeed [see Use in Specific Populations (8.3)].

**Handling of ZOMIG-ZMT Orally Disintegrating Tablets**
Inform patients not to break ZOMIG-ZMT oral disintegrating tablets. Inform patients that the orally disintegrating tablet is packaged in a blister. Instruct patients not to remove the oral disintegrating tablet from the blister until just prior to dosing. Instruct patients that prior to dosing, peel open the blister pack and place the orally disintegrating tablet on the tongue, where it will dissolve and be swallowed with the saliva [see Dosage and Administration (2.2)].

**Patients with Phenylketonuria**
Inform patients with phenylketonuria (PKU) that ZOMIG-ZMT contains phenylalanine (a component of aspartame) [see Warnings and Precautions (5.9)].
Patient Information
ZOMIG® (Zo-mig)
(zolmitriptan)
Tablets
ZOMIG-ZMT® (Zo-mig ZMT)
(zolmitriptan)
Oral Disintegrating Tablets

Please read this information before you start taking ZOMIG and each time you renew your prescription just in case anything has changed. Remember, this summary does not take the place of discussions with your doctor. You and your doctor should discuss ZOMIG when you start taking your medication and at regular checkups.

What is ZOMIG?
ZOMIG is a prescription medication used to treat migraine headaches in adults. ZOMIG is not for other types of headaches. The safety and efficacy of ZOMIG in patients under 18 have not been established.

What is a Migraine Headache?
Migraine is an intense, throbbing headache. You may have pain on one or both sides of your head. You may have nausea and vomiting, and be sensitive to light and noise. The pain and symptoms of a migraine headache can be worse than a common headache. Some women get migraines around the time of their menstrual period. Some people have visual symptoms before the headache, such as flashing lights or wavy lines, called an aura.

How does ZOMIG work?
Treatment with ZOMIG reduces swelling of blood vessels surrounding the brain. This swelling is associated with the headache pain of a migraine attack. ZOMIG blocks the release of substances from nerve endings that cause more pain and other symptoms like nausea, and sensitivity to light and sound. It is thought that these actions contribute to relief of your symptoms by ZOMIG.

Who should not take ZOMIG?
Do not take ZOMIG if you:

- Have heart disease or a history of heart disease
- Have uncontrolled high blood pressure
• Have hemiplegic or basilar migraine (if you are not sure about this, ask your doctor)
• Have or had a stroke or problems with your blood circulation
• Have serious liver problems
• Have taken any of the following medicines in the last 24 hours: other “triptans” like almotriptan (AXERT®), eletriptan (RELPAX®), frovatriptan (FROVA®), naratriptan (AMERGE®), rizatriptan (MAXALT®), sumatriptan (IMITREX®), sumatriptan/naproxen (TREXIMET); ergotamines like BELLERGAL-S®, CAFERGOT®, ERGOMAR®, WIGRAINE®; dihydroergotamine like D.H.E. 45® or MIGRANAL®; or methysergide (SANSERT®). These medications have side effects similar to ZOMIG.
• Have taken monoamine oxidase (MAO) inhibitors such as phenelzine sulfate (NARDIL®) or tranylcypromine sulfate (PARNATE®) for depression or other conditions within the last 2 weeks.
• Are allergic to ZOMIG or any of its ingredients. The active ingredient is zolmitriptan. The inactive ingredients are listed at the end of this leaflet.

Tell your doctor about all the medicines you take or plan to take, including prescription and non-prescription medicines, supplements, and herbal remedies.

Tell your doctor if you are sensitive to phenylalanine, which can be found in the artificial sweetener aspartame. ZOMIG-ZMT contains phenylalanine.

Tell your doctor if you are taking selective serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs), two types of drugs for depression or other disorders. Common SSRIs are CELEXA® (citalopram HBr), LEXAPRO® (escitalopram oxalate), PAXIL® (paroxetine), PROZAC® (fluoxetine), SYMBYAX® (olanzapine/fluoxetine), ZOLOFT® (sertraline), SARAFEM® (fluoxetine) and LUVOX® (fluvoxamine). Common SNRIs are CYMBALTA® ( duloxetine) and EFFEXOR® (venlafaxine). Your doctor will decide if you can take ZOMIG with your other medicines.

Tell your doctor if you know that you have any of the following: risk factors for heart disease like high cholesterol, diabetes, smoking, obesity (overweight), menopause, or a family history of heart disease or stroke.
Tell your doctor if you are pregnant, planning to become pregnant, breast feeding, planning to breast feed, or not using effective birth control.

**How should I take ZOMIG?**

- Take ZOMIG exactly as your doctor tells you to take it. Your doctor will tell you how much ZOMIG to take and when to take it.
- If you take ZOMIG-ZMT Oral Disintegrating tablets, do not remove the tablet from the blister pack until you are ready to take your medicine.
- You do not need to take any liquids with your ZOMIG-ZMT Oral Disintegrating tablets.
- Take ZOMIG-ZMT Orally Disintegrating tablets whole.
- Place ZOMIG-ZMT Oral Disintegrating tablets on your tongue, where it will dissolve.
- Safely throw away any unused tablets or pieces of tablets that have been removed from the blister packaging.
- If your headache comes back after your first dose, you may take a second dose anytime after 2 hours of taking the first dose. For any attack where the first dose did not work, do not take a second dose without talking with your doctor. Do not take more than a total of 10mg of ZOMIG (tablets or spray combined in any 24 hour period. If you take too much medicine, contact your doctor, hospital emergency department, or poison control center right away.

**What are the possible side effects of ZOMIG?**

ZOMIG is generally well tolerated. As with any medicine, people taking ZOMIG may have side effects. The side effects are usually mild and do not last long.

The most common side effects of ZOMIG are:

- Pain, pressure or tightness in the neck, throat or jaw
- Dizziness
- Tingling or other abnormal sensations
- Tiredness
- Drowsiness
- Feeling warm or cold
- Nausea
- Feeling of tightness or heaviness in other areas of the body
- Dry mouth

In very rare cases, patients taking triptans may experience serious side effects, such as heart attacks, high blood pressure,
stroke, or serious allergic reactions. Extremely rarely, patients have died. **Call your doctor right away if you have any of the following problems after taking ZOMIG:**

- severe tightness, pain, pressure or heaviness in your chest, throat, neck, or jaw
- shortness of breath or wheezing
- sudden or severe stomach pain
- hives; tongue, mouth, or throat swelling
- problems seeing
- unusual weakness or numbness

Some people may have a reaction called serotonin syndrome, which can be life-threatening, when they use ZOMIG. In particular, this reaction may occur when they use ZOMIG together with certain types of antidepressants known as SSRIs or SNRIs. Symptoms may include mental changes (hallucinations, agitation, coma), fast heartbeat, changes in blood pressure, high body temperature or sweating, tight muscles, trouble walking, nausea, vomiting, and diarrhea. Call your doctor immediately if you have any of these symptoms after taking ZOMIG.

**This is not a complete list of side effects. Talk to your doctor if you develop any symptoms that concern you.**

**What to do in case of an overdose?**
Call your doctor or poison control center or go to the nearest hospital emergency room.

**General advice about ZOMIG**
Medicines are sometimes prescribed for conditions that are not mentioned in patient information leaflets. Do not use ZOMIG for a condition for which it was not prescribed. Do not give ZOMIG to other people, even if they have the same symptoms as you. People may be harmed if they take medicines that have not been prescribed for them.

This leaflet summarizes the most important information about ZOMIG. If you would like more information about ZOMIG, talk to your doctor. You can ask your doctor or pharmacist for information on ZOMIG that is written for healthcare professionals. You can also call 1-800-236-9933 or visit our website at www.ZOMIG.com.

**What are the Ingredients in ZOMIG?**
ZOMIG Tablets
Active ingredient: zolmitriptan
Inactive ingredients: anhydrous lactose NF, microcrystalline cellulose NF, sodium starch glycolate NF, magnesium stearate

Reference ID: 3186822
NF, hydroxypropyl methylcellulose USP, titanium dioxide USP, polyethylene glycol 400 NF, yellow iron oxide NF (2.5 mg tablet), red iron oxide NF (5 mg tablet), and polyethylene glycol 8000 NF

ZOMIG-ZMT Orally Disintegrating Tablets
Active ingredient: zolmitriptan
Inactive ingredients: mannitol USP, microcrystalline cellulose NF, crospovidone NF, aspartame NF, sodium bicarbonate USP, citric acid anhydrous USP, colloidal silicon dioxide NF, magnesium stearate NF and orange flavor SN 027512

Store both ZOMIG Tablets and ZOMIG-ZMT Orally Disintegrating Tablets at controlled room temperature, 68°F to 77°F (20°C to 25°C) and away from children. Protect from light and moisture. Discard when expired.
