

635-50-951-5

ORTHO TRI-CYCLEN® Lo Tablets (norgestimate/ethinyl estradiol)

Patients should be counseled that this product does not protect against HIV infection (AIDS) and other sexually transmitted diseases

DESCRIPTION ORTHO TRI-CYCLEN® Lo Tablets is a combination oral contraceptive containing the progestational compound norgestimate and the estrogenic compound ethinyl

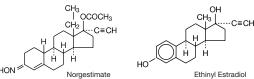

ORTHO TRI-CYCLEN® Lo Tablets

Each white tablet contains 0.180 mg of the progestational compound, norgestimate (+)-13-Ethyl-17-hydroxy-18, 19-dinor-17 α -pregn-4-en-20-yn-3-one oxime acetate (ester) and 0.025 mg of the estrogenic compound, ethinyl estradiol (19-nor-17 α -pregna,1,3,5(10)-trien-20-yne-3,17-diol). Inactive ingredients include lactose, magnesium stearate, croscarmellose sodium, microcrystalline cellulose, carnauba wax, hypromellose, polyethylene glycol, titanium dioxide, and purified water.

wax, hypomeliose, polyethylene glycol, titanium dioxide, and purfied water. Each light blue tablet contains 0.215 mg of the progestational compound norges-timate (+)-13-Ethyl-17-hydroxy-18, 19-dinor-17a-pregn-4-en-20-yn-3-one oxime acetate (ester) and 0.025 mg of the estrogenic compound, ethinyl estradiol (19-nor-17a-pregna, 1,3,5(10)-trien-20-yne-3,17-diol). Inactive ingredients include FD & C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, croscarmellose sodium, microcrystalline cellulose, carnauba wax, hypromellose, polyethylene glycol, tita-nium dioxide, and purfied water.

Thum doxide, and pullined water. Each dark blue tablet contains 0.250 mg of the progestational compound norges-timate (+)-13-Ethyl-17-hydroxy-18, 19-dinor-17α-pregn-4-en-20-yn-3-one oxime acetate (ester) and 0.025 mg of the estrogenic compound, ethniyl estradiol (19-nor-17α-pregna,1,3,5(10)-trien-20-yne-3,17-diol). Inactive ingredients include FD & C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, croscarmellose sodium, microcrystalline cellulose, polysorbate 80, carnauba wax, hypromellose, polyeth-ylene glycol, titanium dioxide, and purified water.

Each dark green tablet contains only inert ingredients, as follows: FD & C Blue No 2 Aluminum Lake, lactose, magnesium stearate, pregelatinized starch, ferric oxide, hypromellose, polyethylene glycol, titanium dioxide, talc and purified water.

CLINICAL PHARMACOLOGY

Oral Contraception

Combination oral contraceptives act by suppression of gonadotropins. Although the primary mechanism of this action is inhibition of ovulation, other alterations in-clude changes in the cervical mucus (which increase the difficulty of sperm entry into the uterus) and the endometrium (which reduce the likelihood of implantation). Income userus and the encometerium (which reduce the likelihood of implantation). Receptor binding studies, as well as studies in animals and humans, have show that norgestimate and 17-deacetyl norgestimate, the major serum metabolite, combine high progestational activity with minimal intrinsic androgenicity.⁵⁰⁻³³ Norgestimate, in combination with ethinyl estradiol, does not counteract the estrogen-induced increases in sex hormone binding globulin (SHBG), resulting in lower serum testosterone.^{50,91,94}

PHARMACOKINETICS Absorption

Norgestimate (NGM) and ethinyl estradiol (EE) are rapidly absorbed following oral administration. Norgestimate is rapidly and completely metabolized by first-pass (intestinal and/or hepatic) mechanisms to norelgestromin (NGMN) and norgestrel (NG), which are the major active metabolites of norgestimate. Mean pharmacokinetic parameters for NGMN, NG and EE during three cycles of administration of ORTHO TRI-CYCLEN® Lo are summarized in Table 1. These results indicate that: (1) Peak serum concentrations of NGMN and EE were generally reached by 2 hours after dosing; (2) Accumulation following multiple dosing of the 180 µg NGM / 25 µg dose is approximately 1.5 to 2 fold for NGMN and approximately 1.5 fold for EE com-pared with single dose administration, in agreement with that predicted based on linear kinetics of NGMN and EE; (3) The kinetics of NGMN are dose proportional following NGM doses of 180 to 250 µg; (4) Steady-state conditions for NGMN following each NGM dose and for EE were achieved during the three cycle study; (5) Non-linear accumulation (4.5-14.5 fold) of norgestrel was observed as a result of high affinity binding to SHBG, which limits its biological activity.¹⁰⁰ The effect of food on the pharmacokinetics of ORTHO TRI-CYCLEN® Lo has not been studied. Table 1 provides a summary of norelgestromin, norgestrel and ethinyl estradiol Norgestimate (NGM) and ethinyl estradiol (EE) are rapidly absorbed following oral Table 1 provides a summary of norelgestromin, norgestrel and ethinyl estradiol

Distribution

Norelgestromin and norgestrel (a serum metabolite of norelgestromin) are highly bound (>97%) to serum proteins. Norelgestromin is bound to albumin and not to SHBG, while norgestrel is bound primarily to SHBG. Ethinyl estradiol is extensively bound (> 97%) to serum albumin.

Metabolism

Norgestimate is extensively metabolized by first-pass mechanisms in the gastro-intestinal tract and/or liver. Norgestimate's primary active metabolite is norelgestromin. Subsequent hepatic metabolism of norelgestromin occurs and metabolites include norgestrel, which is also active and various hydroxylated and conjugated metabo-lites. Ethinyl estradiol is also metabolized to various hydroxylated products and their glucuronide and sulfate conjugates.

ORTHO TRI-CYCLEN® Lo Tablets (norgestimate/ethinyl estradiol)

Patients should be counseled that this product does not protect against HIV infection (AIDS) and other sexually

 Severe hypertension
 Diabetes with vascular involvement
 Headaches with focal neurological symptoms
 Major surgery with prolonged immobilization
 Known or suspected carcinoma of the breast or personal history of breast cancer
 Carcinoma of the endometrium or other known or suspected estrogen-dependent neoplasia Undiagnosed abnormal genital bleeding
Cholestatic jaundice of pregnancy or jaundice with prior pill use

Hepatic adenomas or carcinomas

Known or suspected pregnancy · Hypersensitivity to any component of this product

WARNINGS

Cigarette smoking increases the risk of serious cardiovascular side effects from oral contraceptive use. This risk increases with age and with heavy smoking (15 or more cigarettes per day) and is quite marked in women over 35 years of age. Women who use oral contraceptives should be strongly advised not to smoke.

The use of oral contraceptives is associated with increased risks of several serious conditions including myocardial infarction, thromboembolism, stroke, hepatic neo plasia, and gailbladder disease, although the risk of serious morbidity or mortality is very small in healthy women without underlying risk factors. The risk of morbid-ity and mortality increases significantly in the presence of other underlying risk factors such as hypertension, hyperlipidemias, obesity and diabetes.

Practitioners prescribing oral contraceptives should be familiar with the following information relating to these risks.

The information contained in this package insert is principally based on studies carried out in patients who used oral contraceptives with higher formulations of estrogens and progestogens than those in common use today. The effect of long-term use of the oral contraceptives with lower formulations of both estrogens and progestogens remains to be determined.

progestogens remains to be determined. Throughout this labeling, epidemiological studies reported are of two types: retro-spective or case control studies and prospective or cohort studies. Case control studies provide a measure of the relative risk of a disease, namely, a ratio of the incidence of a disease among oral contraceptive users to that among nonusers. The relative risk does not provide information on the actual clinical occurrence of a disease. Cohort studies provide a measure of attributable risk, which is the dif-ference in the incidence of disease between oral contraceptive users and nonusers. The attributable risk does provide information about the actual occurrence of a disease in the population (adapted from refs. 2 and 3 with the author's permission). For further information, the reader is referred to a text on epidemiological methods. **1. Thromboembolic Disorders and Other Vascular Problems** 1. Thromboembolic Disorders and Other Vascular Problems

a. Myocardial Infarction

An increased risk of myocardial infarction has been attributed to oral contraceptive Annoteased norm of any other mathematical set of an another to the contracepture use. This risk is primarily in smokers or women with other underlying risk factors for coronary artery disease such as hypertension, hypercholesterolemia, morbid obesity, and diabetes. The relative risk of heart attack for current oral contraceptive users has been estimated to be two to six.⁴⁻¹⁰ The risk is very low under the rag of 30 age of 30

Smoking in combination with oral contraceptive use has been shown to contribute substantially to the incidence of myocardial infarctions in women in their mid-thirties or older with smoking accounting for the majority of excess cases.¹¹ Mortality rates

associated with circulatory disease have been shown to increase substantially in smokers, especially in those 35 years of age and older and in nonsmokers over the age of 40 among women who use oral contraceptives.

Figure 1: Circulatory Disease Mortality Rates Per 100,000 Women-Years By Age, Smoking Status And Oral Contraceptive Use

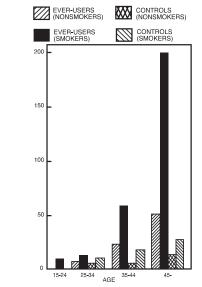

Figure 1 Adapted from P.M. Layde and V. Beral, Ref. #12.

Oral contraceptives may compound the effects of well-known risk factors, such as hypertension, diabetes, hyperlipidemias, age and obesity.¹³ In particular, some progestogens are known to decrease HDL cholesterol and cause glucose intoler-ance, while estrogens may create a state of hyperinsulinism.¹⁴⁻¹⁶ Oral contracep-tives have been shown to increase blood pressure among users (see section 9 in WARNINGS). Similar effects on risk factors have been associated with an increased risk of heart disease. Oral contraceptives must be used with caution in women with cardiovascular disease risk factors.

Norgestimate has minimal androgenic activity (see CLINICAL PHARMACOLOGY), and there is some evidence that the risk of myocardial infarction associated with oral contraceptives is lower when the progestogen has minimal androgenic activity than when the activity is greater.

b. Thromboembolism

An increased risk of thromboembolic and thrombotic disease associated with the use of oral contraceptives is well established. Case control studies have found the use of oral contraceptives is well established. Case control studies have found the relative risk of users compared to nonusers to be 3 for the first episode of super-ficial venous thrombosis, 4 to 11 for deep vein thrombosis or pulmonary embolism, and 1.5 to 6 for women with predisposing conditions for venous thromboembolic disease.^{2,3,19:24} Cohort studies have shown the relative risk to be somewhat lower, about 3 for new cases and about 4.5 for new cases requiring hospitalization.²⁵ The risk of thromboembolic disease associated with oral contraceptives is not related to length of use and disappears after pill use is stopped.² A two- to four-fold increase in relative risk of post-operative thromboembolic complications has been reported with the use of oral contraceptives.⁹ The relative risk of venous thrombosis in women who have predisposing conditions is twice that of women without such medical conditions.²⁶ If feasible, oral contraceptives should be discontinued at least four weeks prior to and for two weeks after elective surger of a type associated with an increase in risk of thromboembolism and during and following prolonged immobilization. Since the immediate postpartum period is also associated with an increased risk of thromboembolism, oral contraceptives should be started no earlier than four weeks after delivery in women who elect not to to the started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than four weeks after delivery in women who elect not to be started no earlier than the started not be the started not be

5. Ocular Lesions

There have been clinical case reports of retinal thrombosis associated with the use of oral contraceptives. Oral contraceptives should be discontinued if there is un-explained partial or complete loss of vision; onset of proptosis or diplopia; papilledema; or retinal vascular lesions. Appropriate diagnostic and therapeutic measures should be undertaken immediately.

Effects related to inhibition of ovulation:

To achieve maximum contraceptive effectiveness, ORTHO TRI-CYCLEN® Lo Tablets

To achieve maximum contraceptive elective less, on the three releases must be taken exactly as directed and at intervals not exceeding 24 hours. The possibility of ovulation and conception prior to initiation of medication should be considered. ORTHO TRI-CYCLEN® Lo is available in the DIALPAK® Tablet Dispenser

Sunday Start When taking ORTHO TRI-CYCLEN® Lo the first white "active" tablet should be taken on the first Sunday after menstruation begins. If the menstrual period begins on Sunday, the first white "active" tablet should be taken that day. Take one white, light blue or dark blue "active" tablet daily for 21 days followed by one dark green "re-minder" tablet daily for 7 days. After 28 tablets have been taken, a new course is started the next day (Sunday). For the first cycle of a Sunday Start regimen, an-other method of contraception should be used until after the first 7 consecutive days of administration

If the patient misses one (1) white, light blue, or dark blue "active" tablet in Weeks

If the patient misses one (1) white, light blue, or dark blue "active" tablet in Weeks 1, 2, or 3, the tablet should be taken as soon as she remembers. If the patient misses two (2) white or light blue "active" tablets in Week 1 or Week 2, the patient should take two (2) "active" tablets the day she remembers and two (2) "active" tablets the next day; and then continue taking one (1) tablet a day until she finishes the pack. The patient should be instructed to use a back-up method of birth control if she has sex in the seven (7) days after missing pills. If the patient misses two (2) dark blue "active" tablets in the third week or misses three (3) or more "active" tablets in a row, the patient should continue taking one tablet every day until Sunday. On Sunday the patient should chrow out the rest of the pack and start a new pack that same day. The patient should be instructed to use a back-up method of birth con-trol if she has sex in the seven (7) days after missing pills.

Complete instructions to facilitate patient counseling on proper pill usage may be found in the Detailed Patient Labeling ("How to Take the Pill" section).

The dosage of ORTHO TRI-CYCLEN® Lo for the initial cycle of therapy is one white, light blue or dark blue "active" tablet administered daily from the 1st day through the 21st day of the menstrual cycle, counting the first day of menstrual flow as "Day 1" followed by one dark green "reminder" tablet daily for 7 days. Tablets are taken without interruption for 28 days. After 28 tablets have been taken, a new course is started the next day.

If the patient misses one (1) white, light blue, or dark blue "active" tablet in Weeks

1, 2, or 3, the tablet should be taken as soon as she remembers. If the patient misses two (2) white or light blue "active" tablets in Week 1 or Week 2, the patient should take two (2) "active" tablets the day she remembers and two (2) "active" tablets the

take two (2) "active" tablets the day she remembers and two (2) "active" tablets the next day; and then continue taking one (1) tablet a day until she finishes the pack. The patient should be instructed to use a back-up method of birth control if she has sex in the seven (7) days after missing pills. If the patient misses two (2) dark blue "active" tablets in the third week or misses three (3) or more "active" tablets in a row, the patient should be instructed to use a back-up method of birth con-trol if she has sex in the seven (7) days after missing pills.

Complete instructions to facilitate patient counseling on proper pill usage may be found in the Detailed Patient Labeling ("How to Take the Pill" section). When switching from another oral contraceptive, ORTHO TRI-CYCLEN® Lo should be started on the same day that a new pack of the previous oral contraceptive would have been started.

The use of ORTHO TRI-CYCLEN® Lo for contraception may be initiated 4 weeks

The use of ORTHO THI-CYCLEN® Lo for contraception may be initiated 4 weeks postpartum in women who elect not to breastfeed. When the tablets are adminis-tered during the postpartum period, the increased risk of thromboembolic disease associated with the postpartum period must be considered. (See CONTRAINDI-CATIONS and WARNINGS concerning thromboembolic disease. See also PRE-CAUTIONS for *Nursing Mothers.") The possibility of ovulation and conception prior to initiation of medication should be considered.

(See Discussion of Dose-Related Risk of Vascular Disease from Oral

Breakthrough bleeding, spotting, and amenorrhea are frequent reasons for patients discontinuing oral contraceptives. In breakthrough bleed-ing, as in all cases of irregular bleeding from the vagina, nonfunctional

causes should be borne in mind. In undiagnosed persistent or recur-rent abnormal bleeding from the vagina, adequate diagnostic measures

rent abnormal bleeding from the vagina, adequate blagnostic measures are indicated to rule out pregnancy or malignancy. If gathology has been excluded, time or a change to another formulation may solve the prob-lem. Changing to an oral contraceptive with a higher estrogen content, while potentially useful in minimizing menstrual irregularity, should be done only if necessary since this may increase the risk of thromboem-bolic disease.

Use of oral contraceptives in the event of a missed menstrual period:

If the patient has not adhered to the prescribed schedule, the pos-sibility of pregnancy should be considered at the time of the first missed period and oral contraceptive use should be discontinued if pregnancy is continued.

2. If the patient has adhered to the prescribed regimen and misses two consecutive

periods, pregnancy should be ruled out before continuing oral contraceptive use

RTHO TRI-CYCLEN® Lo Tablets are available in a DIALPAK® Tablet Dispenser (NDC

ORTHO TRI-CYCLEN® Lo Tablets are available in a DIALPAK® Tablet Dispenser (NDC 0062-1251-15) containing 28 tablets. Each of the 7 white, round, convex, coated tablets imprinted "O-M" on one side and "180" on the other side contains 0.180 mg of the progestational compound, norgestimate, together with 0.025 mg of the estrogenic compound, ethinyl estradiol. Each of the 7 light blue, round, convex, coated tablets imprinted "O-M" on one side and "215" on the other side contains 0.215 mg of the progestational compound, norgestimate, together with 0.025 mg of the estrogenic compound, ethinyl estradiol. Each of the 7 dark blue, round, convex, coated tablets imprinted "O-M" on one side and "250" on the other side contains 0.216 mg of the progestational compound, norgestimate, together with 0.025 mg of the estrogenic compound, ethinyl estradiol. Each of the 7 dark blue, round, convex, coated tablets imprinted "O-M" on one side and "250" on the other side contains 0.250 mg of the progestational compound, norgestimate, together with 0.025 mg of the estrogenic compound, ethinyl estradiol. Each of the 7 dark blue, round, convex, coated tablets imprinted "O-M" on one side and "250" on the other side contains inert ingredients.

ORTHO TRI-CYCLEN® Lo Tablets are available for clinic usage in a VERIDATE® Tablet Dispenser (unfilled) and VERIDATE Refills (NDC 0062-1251-20).

PETENCES 10. The Source of the

Store at 25°C (77°F); excursions permitted to 15° - 30°C (59° - 86°F)

ADDITIONAL INSTRUCTIONS FOR ALL DOSING REGIMENS

which is preset for a Sunday Start. Day 1 Start is also provided.

6. Oral Contraceptive Use Before or During Early Pregnancy

Extensive epidemiological studies have revealed no increased risk of birth defects in women who have used oral contraceptives prior to pregnancy^{56,57} The majority of recent studies also do not indicate a teratogenic effect, particularly in so far as cardiac anomalies and limb reduction defects are concerned,^{55,68,85,69} when taken inadvertently during early pregnancy.

The administration of oral contraceptives to induce withdrawal bleeding should not be used as a test for pregnancy. Oral contraceptives should not be used during pregnancy to treat threatened or habitual abortion.

It is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. Oral contraceptive use should be discontinued if pregnancy is confirm

7. Gallbladder Disease

Earlier studies have reported an increased lifetime relative risk of gallbladder surgery in users of oral contraceptives and estrogens.^{60,61} More recent studies, however, have shown that the relative risk of developing gallbladder disease among oral con-traceptive users may be minimal.^{62,64} The recent findings of minimal risk may be related to the use of oral contraceptive formulations containing lower hormonal doses of extreme and mercentaneous of estrogens and progestogens

8. Carbohydrate and Lipid Metabolic Effects

8. Carbonydrate and Lipid Metabolic Effects Oral contraceptives have been shown to cause a decrease in glucose tolerance in a significant percentage of users.¹⁷ This effect has been shown to be directly related to estrogen dose.⁶⁶ Progestogens increase insulin secretion and create insulin re-sistance, this effect varying with different progestational agents.^{17,66} However, in the non-diabetic woman, oral contraceptives appear to have no effect on fasting blood glucose.⁶⁷ Decause of these demonstrated effects, prediabetic and diabetic women in particular should be carefully monitored while taking oral contraceptives. A percent demonstrate of fects the production and the production of the product

A small proportion of women will have persistent hypertriglyceridemia while on the pill. As discussed earlier (see WARNINGS 1a and 1d), changes in serum triglycerides and lipoprotein levels have been reported in oral contraceptive users 9. Elevated Blood Pressure

Women with significant hypertension should not be started on hormonal contra-ception.⁹⁸ An increase in blood pressure has been reported in women taking oral contraceptives⁶⁹ and this increase is more likely in older oral contraceptive users⁶⁹ and with extended duration of use⁵¹ Data from the Royal College of General Practitioners¹² and subsequent randomized trials have shown that the incidence of hypertension increases with increasing progestational activity and concentrations of progestogens. of progestogens.

Women with a history of hypertension or hypertension-related diseases, or renal disease¹⁰ should be encouraged to use another method of contraception. If women elect to use oral contraceptives, they should be monitored closely and if significant elevation of blood pressure occurs, oral contraceptives should be discontinued. For most women, elevated blood pressure will return to normal after stopping oral contraceptives, and there is no difference in the occurrence of hypertension between former and never users.⁶⁸⁻⁷¹

10. Headache

The onset or exacerbation of migraine or development of headache with a new pattern which is recurrent, persistent or severe requires discontinuation of ora contraceptives and evaluation of the cause.

11. Bleeding Irregularities

11. Siecong irregularities Breakthrough bleeding and spotting are sometimes encountered in patients on oral contraceptives, especially during the first three months of use. Non-hormonal causes should be considered and adequate diagnostic measures taken to rule out malignancy or pregnancy in the event of breakthrough bleeding, as in the case of any abnormal vaginal bleeding. If pathology has been excluded, time or a change to another formulation may solve the problem. In the event of amenorhae, preg-nancy should be ruled out.

Some women may encounter post-pill amenorrhea or oligomenorrhea, especially when such a condition was preexistent.

12. Ectopic Pregnancy Ectopic as well as intrauterine pregnancy may occur in contraceptive failures.

PRECAUTIONS

Patients should be counseled that this product does not protect against HIV infection (AIDS) and other sexually transmitted diseases

2. Physical Examination and Follow-Up

It is good medical practice for all women to have annual history and physical examinations, including women using oral contraceptives. The physical examination, however, may be deferred until after initiation of oral contraceptives if re quested by the woman and judged appropriate by the clinician. The physical examination should include special reference to blood pressure, breasts, abdomen and multiformania multiformatical and the second section and the second section and the second section and pelvic and second section and second section and second section and second se history of breast cancer or who have breast nodules should be monitored with particular care.

3. Lipid Disorders

Women who are being treated for hyperlipidemias should be followed closely if they elect to use oral contraceptives. Some progestogens may elevate LDL levels and may render the control of hyperlipidemias more difficult.

4. Liver Function

If jauncice develops in any woman receiving oral contraceptives, the medication should be discontinued. Steroid hormones may be poorly metabolized in patients with impaired liver function.

5. Fluid Retention

Oral contraceptives may cause some degree of fluid retention. They should be pre-scribed with caution, and only with careful monitoring, in patients with conditions which might be aggravated by fluid retention.

6. Emotional Disorders

Women with a history of depression should be carefully observed and the drug discontinued if depression recurs to a serious degree.

7. Contact Lenses Contact lens wearers who develop visual changes or changes in lens tolerance should be assessed by an ophthalmologist.

8. Drug Interactions

Changes in contraceptive effectiveness associated with co-administration of

other products:

other products: Contraceptive effectiveness may be reduced when hormonal contraceptives are coadministered with antibiotics, anticonvulsants, and other drugs that increase the metabolism of contraceptive steroids. This could result in unintended pregnancy or breakthrough bleeding. Examples include rifampin, barbiturates, phenylbutazone, phenytoin, carbamazepine, felbamate, oxcarbazepine, topiramate, griseofulvin and been reported in the literature with concomitant administration of antibiotics such as ampicillin and tetracyclines. However, clinical pharmacology studies investigat-ing drug interaction between combined oral contraceptives and these antibiotics have reported in consistent results. have reported inconsistent results.

Several of the anti-HIV protease inhibitors have been studied with co-administra Severate of the anisotropy processes immunous takes deem staated when of caraministrate tion of oral combination hormional contraceptives; significant changes (increase and decrease) in the plasma levels of the estrogen and progestin have been noted in some cases. The safety and efficacy of oral contraceptive products may be affected with coadministration of anti-HIV protease inhibitors. Healthcare professionals should refer to the label of the individual anti-HIV protease inhibitors for further drugdrug interaction information.

Herbal products containing St. John's Wort (hypericum perforatum) may induce hepatic enzymes (cytochrome P450) and p-glycoprotein transporter and may reduce the effectiveness of contraceptive steroids. This may also result in breakthrough blocatine hleeding

Concurrent use of bosentan and ethinyl estradiol containing products may result in decreased concentrations of these contraceptive hormones thereby increasing the risk of unintended pregnancy and unscheduled bleeding. Increase in plasma ethinyl estradiol levels associated with co-administered

drugs: Co-administration of atorvastatin and certain oral contraceptives containing ethinyl estradiol increase AUC values for ethinyl estradiol by approximately 20%. Ascorbic acid and acetaminophen may increase plasma ethinyl estradiol levels, possibly by inhibition of conjugation. CYP 3A4 inhibitors such as itraconazole or ketoconazole

Following 3 cycles of administration of ORTHO TRI-CYCLEN® Lo, the mean (\pm SD) elimination half-life values, at steady-state, for norelgestromin, norgestrel and ethinyl estradiol were 28.1 (\pm 10.6) hours, 36.4 (\pm 10.2) hours and 17.7 (\pm 4.4) hours, respectively (Table 1). The metabolites of norelgestromin and ethinyl estradiol are eliminated by renal and fecal pathways.

Special Populations

Effects of Body Weight, Body Surface Area, and Age

Effects of Body Weight, Body Surface Area, and Age The effects of body weight, body surface area, age and race on the pharmaco-kinetics of norelgestromin, norgestrel and ethinyl estradiol were evaluated in 79 healthy women using pooled data following single dose administration of NGM 180 or 250 µg / EE 25 µg tablets in four pharmacokinetic studies. Increasing body weight and body surface area were each associated with decreases in C_{max} and AUC_{0-24N} values for norelgestromin and ethinyl estradiol and increases in C_LF (oral clearance) for ethinyl estradiol. Increasing body weight by 10 kg is predicted to reduce the fol-lowing parameters: NGMN C_{max} by 9% and AUC_{0-24h} by 19%, norgestrel C_{max} by 12% and AUC_{0-24h} by 46%, EE C_{max} by 13% and AUC_{0-24h} by 12%. These changes (6% with increasing age by 5 years) in C_{max} and AUC_{0-24h} for norelgestromin and were statistically significant. Increasing age was associated with slight decreases (6% with increasing age by 5 years) in C_{max} and AUC_{0-24h} for noreglestromin and were statistically significant, but there was no significant effect for norgestrel or ethinyl estradiol. Only a small to moderate fraction (5-40%) of the overall variability in the pharmacokinetics of norelgestromin and ethinyl estradiol for above demographic TRI-CYCLEN® Lo Tablets may be explained by any or all of the above demographic

In clinical studies involving 1673 subjects with a mean weight of 141 pounds, there was no association between pregnancy and weight.

Renal and Hepatic Impairment

No studies with ORTHO TRI-CYCLEN® Lo have been conducted in women with renal or hepatic impairment

Drug-Drug Interactions

Although norelgestromin and its metabolites inhibit a variety of P450 enzymes in human liver microsomes, under the recommended dosing regimen, the in vivo con-centrations of norelgestromin and its metabolites, even at the peak serum levels, are relatively low compared to the inhibitory constant (K).

Interactions between oral contraceptives and other drugs have been reported in the literature. No formal drug-drug interaction studies were conducted with ORTHO TRI-CYCLEN® Lo (see PRECAUTIONS).

INDICATIONS AND USAGE ORTHO TRI-CYCLEN® Lo Tablets are indicated for the prevention of pregnancy in women who elect to use oral contraceptives as a method of contraception. In an active controlled clinical trial 1,673 subjects completed 11,003 cycles of ORTHO TRI-CYCLEN® Lo use and a total of 20 pregnancies were reported in ORTHO TRI-CYCLEN® Lo users.⁹⁹ This represents an overall use-efficacy

(typical user efficacy) pregnancy rate of 2.36 per 100 women-years of use. Oral contraceptives are highly effective for pregnancy prevention. Table 2 lists the typical accidental pregnancy rates for users of combination oral contraceptives and other methods of contraception. The efficacy of these contraceptive methods, except sterilization, the IUD, and the Norplant[®] system, depends upon the reliabil-ity with which they are used. Correct and consistent use of methods can result in lower failure rates

lower failure rates. Table 2: Percentage Of Women Experiencing An Unintended Pregnancy During The First Year Of Typical Use And The First Year Of Perfect Use Of Contraception And The Percentage Continuing Use At The End

Among typical couples who initiate use of a method (not necessarily for the first Among typical couples who initiate use of a method (not necessarily for the first time), the percentage who experience an accidental pregnancy during the first year if they do not stop use for any other reason. Among couples who initiate use of a method (not necessarily for the first time) and who use it *perfectly* (both consistently and correctly), the percentage who experience an accidental pregnancy during the first year if they do not stop use for any other reason.

for any other reason.

Among couples attempting to avoid pregnancy, the percentage who continue to use a method for one year. ⁴ The percents becoming pregnant in columns (2) and (3) are based on data from

populations where contraception is not used and from women who cease using contraception in order to become pregnant. Among such populations, about 89% become pregnant within one year. This estimate was lowered slightly (to 85%) to represent the percent who would become pregnant within one year among women now relying on reversible methods of contraception if they abandoned contra ception altogether.

Foams, creams, gels, vaginal suppositories, and vaginal film. Cervical mucus (ovulation) method supplemented by calendar in the pre-ovulatory

and basal body temperature in the post-ovulatory phases.

With spermicidal cream or jelly.

⁹ The trea

With spermicidal cream or jelly. Without spermicides. The treatment schedule is one dose within 72 hours after unprotected intercourse, and a second dose 12 hours after the first dose. The FDA has declared the following brands of oral contraceptives to be safe and effective for emergency contraception: Ovral[®] (1 dose is 2 white pills), Alesse[®] (1 dose is 5 pink pills), Nordette[®] or Levlen[®] (1 dose is 4 yellow pills). [®]However, to maintain effective protection against pregnancy, another method of contraception must be used as soon as menstruation resumes, the frequency or duration of breastfeeds is reduced, bottle feeds are introduced, or the baby reaches 6 months of ace.

reaches 6 months of age.

ORTHO TRI-CYCLEN® Lo has not been studied for and is not indicated for use ncv contracention

CONTRAINDICATIONS

Oral contraceptives should not be used in women who have any of the following conditions

Thrombophlebitis or thromboembolic disorders

A past history of deep vein thrombophlebitis or thromboembolic disorders Cerebral vascular or coronary artery disease (current or history) Valvular heart disease with complications

c. Cerebrovascular Diseases

c. Geneurovascular Diseases Oral contraceptives have been shown to increase both the relative and attributable risks of cerebrovascular events (thrombotic and hemorrhagic strokes), although, in general, the risk is greatest among older (-35 years), hypertensive women who also smoke. Hypertension was found to be a risk factor for both users and nonusers, for both types of strokes, and smoking interacted to increase the risk of hemor-hagic stroke ²⁷⁻²⁹ rhagic stroke

In a large study, the relative risk of thrombotic strokes has been shown to range In a large study, the relative risk of thrombotic strokes has been shown to range from 3 for normotensive users to 14 for users with severe hypertension.³⁰ The relative risk of hemorrhagic stroke is reported to be 1.2 for non-smokers who used oral contraceptives, 2.6 for smokers who did not use oral contraceptives, 7.6 for smokers who used oral contraceptives, 1.8 for normotensive users and 25.7 for users with severe hypertension.³⁰ The attributable risk is also greater in older

d. Dose-Related Risk of Vascular Disease From Oral Contraceptives

A positive association has been observed between the amount of estrogen and progestogen in oral contraceptives and the risk of vascular disease.³¹⁻³³ A decline in serum high density lipoproteins (HDL) has been reported with many progesta-tional agents.¹⁴⁻¹⁶ A decline in serum high density lipoproteins has been associated with an increased incidence of ischemic heart disease. Because estrogens increase UD ebelgenet the out of ford of on contendentian departments of a belgene achieved. HDL cholesterol, the net effect of an oral contraceptive depends on a balance achieved between doses of estrogen and progestogen and the activity of the progestogen used in the contraceptives. The activity and amount of both hormones should be considered in the choice of an oral contraceptive.

considered in the choice of an oral contraceptive. Minimizing exposure to estrogen and progestogen is in keeping with good principles of therapeutics. For any particular estrogen/progestogen combination, the dosage regimen prescribed should be one which contains the least amount of estrogen and progestogen that is compatible with a low failure rate and the needs of the indi-vidual patient. New acceptors of oral contraceptive agents should be started on preparations containing the lowest estrogen content which is judged appropriate for an individual patient.

e. Persistence of Risk of Vascular Disease

There are two studies which have shown persistence of risk of vascular disease for ever-users of oral contraceptives. In a study in the United States, the risk of developing myocardial infarction after discontinuing oral contraceptives persists for at least 9 years for women 40-49 years who had used oral contraceptives for five or more years, but this increased risk was not demonstrated in other age groups.⁸ In another study in Great Britain, the risk of developing cerebrovascular disease persisted for at least 6 years after discontinuation of oral contraceptives, although excess risk was very small.³⁴ However, both studies were performed with oral contraceptive formulations containing 50 micrograms or higher of estrogens

2. Estimates of Mortality from Contraceptive Use

One study gathered data from a variety of sources which have estimated the mor-tality rate associated with different methods of contraception at different ages (Table 3). These estimates include the combined risk of death associated with con-(Table 3). These estimates include the combined risk of death associated with con-traceptive methods plus the risk attributable to pregnancy in the event of method failure. Each method of contraception has its specific benefits and risks. The study concluded that with the exception of oral contraceptive users 35 and older who smoke, and 40 and older who do not smoke, mortality associated with all methods of birth control is low and below that associated with childbirth. The observation of an increase in risk of mortality with age for oral contraceptive users is based on data gathered in the 1970's.³⁵ Current clinical recommendation involves the use of lower estrogen dose formulations and a careful consideration of risk factors. In 1989, the Fertility and Maternal Health Drugs Advisory Committee was asked to review the use of oral contraceptives in women 40 years of age and over. The Committee concluded that althouch cardiovascular disease risks may be in-

The committee concluded that although cardiovascular disease risks may be in-creased with oral contraceptive use after age 40 in healthy non-smoking women (even with the newer low-dose formulations), there are also greater potential health risks associated with pregnancy in older women and with the alternative surgical and medical procedures which may be necessary if such women do not have access to effective and acceptable means of contraceptive use by healthy non-smoking women over 40 may outweigh the possible risks.

Of course, older women, as all women, who take oral contraceptives, should take an oral contraceptive which contains the least amount of estrogen and progesto-

gen that is compatible with a low failure rate and individual patient needs

* Deaths are birth-related **Deaths are method-related Adapted from H.W. Ory, Family Planning Perspectives, Ref. #35.

3. Carcinoma of the Reproductive Organs and Breasts Numerous epidemiological studies have been performed on the incidence of breast,

endometrial, ovarian, and cervical cancer in women using oral contraceptives. The risk of having breast cancer diagnosed may be slightly increased among current and recent users of combination oral contraceptives. However, this excess risk appears to decrease over time after discontinuation of combination oral contra-ceptives and by 10 years after cessation the increased risk disappears. Some studies report an increased risk with duration of use while other studies do not and no consistent relationships have been found with dose or type of steroid. Some studies have found a small increase in risk for women who first use combination oral contraceptives before age 20. Most studies show a similar pattern of risk with combination oral contraceptive use regardless of a woman's reproductive history or her family breast cancer history. endometrial, ovarian, and cervical cancer in women using oral contraceptives.

Breast cancers diagnosed in current or previous oral contraceptive users tend to be less clinically advanced than in nonusers. Women who currently have or have had breast cancer should not use oral contra-

ceptives because breast cancer is usually a hormonally-sensitive tumor.

Some studies suggest that oral contraceptive use has been associated with an increase in the risk of cervical intraepithelial neoplasia in some populations of woren.⁴⁵⁻⁴⁴ However, there continues to be controversy about the extent to which such findings may be due to differences in sexual behavior and other factors. In spite of many studies of the relationship between oral contraceptive use and

ast and cervical cancers, a cause-and-effect relationship has not been established 4. Hepatic Neoplasia

Benign hepatic adenomas are associated with oral contraceptive use, although the Benign hepatic adenomas are associated with oral contraceptive use, although the incidence of benign tumors is rare in the United States. Indirect calculations have estimated the attributable risk to be in the range of 3.3 cases/100,000 for users, a risk that increases after four or more years of use especially with oral contracep-tives of higher dose.[®] Rupture of benign, hepatic adenomas may cause death through intra-abdominal hemorrhage.^{50,51}

Studies from Britain have shown an increased risk of developing hepatocellular carcinoma in long-term (>8 years) oral contraceptive users. However, these cancers are extremely rare in the U.S. and the attributable risk (the excess incidence) of liver cancers in oral contraceptive users approaches less than one per million users

may increase plasma hormone levels.

drugs were administered with oral contraceptives.

Changes in plasma levels of co-administered drugs

Combination hormonal contraceptives containing some synthetic estrogens (e.g., ethinyl estradiol) may inhibit the metabolism of other compounds. Increased plasma concentrations of cyclosporin, prednisolone, and theophylline have been reported with concomitant administration of oral contraceptives. Decreased plasma concentrations of acetaminophen and increased clearance of temazepam, salicylic acid, morphine and clofibric acid, due to induction of conjugation, have been noted when

Combined hormonal contraceptives have been shown to significantly decrease plasma concentrations of lamotrigine when co-administered due to induction of lamotrigine glucuronidation. This may reduce seizure control; therefore, dosage ad-justments of lamotrigine may be necessary.¹⁰³

Healthcare professionals are advised to also refer to prescribing information of coadministered drugs for recommendations regarding management of concomitant

9. Interactions with Laboratory Tests

Certain endocrine and liver function tests and blood components may be affected by oral contraceptives:

a. Increased prothrombin and factors VII, VIII, IX, and X; decreased antithrombin 3; increased norepinephrine-induced platelet aggregability.

b. Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by protein-bound iodine (PBI), T4 by column or by radioimmunoassay. Free T3 resin uptake is decreased, reflecting the elevated TBG, free T4 concentration is unaltered.

c. Other binding proteins may be elevated in serum.

d. Sex hormone binding globulins are increased and result in elevated levels of total circulating sex steroids; however, free or biologically active levels either decrease or remain unchanged.

e. Triglycerides may be increased and levels of various other lipids and lipopro-teins may be affected.

f. Glucose tolerance may be decreased.

g. Serum folate levels may be depressed by oral contraceptive therapy. This may be of clinical significance if a woman becomes pregnant shortly after discontinuing oral contraceptives.

10. Carcinogenesis

See WARNINGS section.

11. Pregnancy Pregnancy Category X, See CONTRAINDICATIONS and WARNINGS sections.

12. Nursing Mothers

Small amounts of oral contraceptive steroids have been identified in the milk of Smail amounts of oral contraceptive steroids have been identified in the milk of nursing mothers and a few adverse effects on the child have been reported, in-cluding jaundice and breast enlargement. In addition, oral contraceptives given in the postpartum period may interfere with lactation by decreasing the quantity and quality of breast milk. If possible, the nursing mother should be advised not to use combination oral contraceptives but to use other forms of contraception until she has completely weaned her child.

13. Pediatric Use

Safety and efficacy of ORTHO TRI-CYCLEN® Lo Tablets have been established in women of reproductive age. Safety and efficacy are expected to be the same for postpubertal adolescents under the age of 16 and for users 16 years and older. Use of this product before menarche is not indicated.

14. Geriatric Use

This product has not been studied in women over 65 years of age and is not indicated in this population

INFORMATION FOR THE PATIENT

See Patient Labeling printed belov

ADVERSE REACTIONS An increased risk of the following serious adverse reactions has been associated with the use of oral contraceptives (see WARNINGS section).

- Thrombophlebitis and venous thrombosis with or without embolism
- Arterial thromboembolism
- Pulmonary embolism Myocardial infarction
- Cerebral hemorrhag
- Cerebral thrombosis
- Hypertension Gallbladder disease
- Hepatic adenomas or benign liver tumors There is evidence of an association between the following conditions and the use of oral contraceptives:
- Mesenteric thrombosis
- Retinal thrombosis

Spotting

Edema

Amenorrhea

The following adverse reactions have been reported in patients receiving oral contraceptives and are believed to be drug-related

Temporary infertility after discontinuation of treatment

Breast changes: tenderness, enlargement, secretion Change in weight (increase or decrease) Change in cervical erosion and secretion

Diminution in lactation when given immediately postpartum

Allergic reaction, including rash, urticaria, and angioedema Mental depression Reduced tolerance to carbohydrates

and the association has been neither confirmed nor refuted

The following adverse reactions have been reported in users of oral contraceptives

Serious ill effects have not been reported following acute ingestion of large doses of oral contraceptives by young children. Overdosage may cause nausea and with-drawal bleeding may occur in females.

The following non-contraceptive health benefits related to the use of combination oral contraceptives are supported by epidemiological studies which largely utilized oral contraceptive formulations containing estrogen doses exceeding 0.035 mg of ethinyl estradiol or 0.05 mg mestranol.⁷³⁻⁷⁸

increased menstrual cycle regularity
decreased blood loss and decreased incidence of iron deficiency anemia

vaginal candidiasis
 Change in corneal curvature (steepening)
 Intolerance to contact lenses

Nausea

Vomiting Gastrointestinal symptoms (such as abdominal cramps and bloating) Breakthrough bleeding Change in menstrual flow

Melasma which may persist

Cholestatic jaundice Migraine

Vaginal candidiasis

Pre-menstrual syndrome
 Cataracts

Changes in appetite Cystitis-like syndrome

Headache Nervousness

Dizziness

Hirsutism

Vaginitis Porphyria

Loss of scalp hair

Erythema multiforme Erythema nodosum

Hemorrhagic eruption

Impaired renal function Hemolytic uremic syndrome

Acne
 Changes in libido
 Colitis

Effects on menses:

 Budd-Chiari Syndrome OVERDOSAGE

NON-CONTRACEPTIVE HEALTH BENEFITS

decreased incidence of dysmenorrhea

BRIEF SUMMARY PATIENT PACKAGE INSERT

BRIEF SUMMARY PATIENT PACKAGE INSERT Oral contraceptives, also known as "birth control pills" or "the pill," are taken to prevent pregnancy. When taken correctly without missing any pills, oral contraceptives are highly effective; however the typical failure rate of large numbers of pill users is 5% per year when women who miss pills are included. Forgetting to take pills considerably increases the chances of pregnancy. For most women oral contra-ceptives are also free of serious or unpleasant side effects. For the majority of women, oral contraceptives can be taken safely. But there are some women who are at high risk of developing certain serious diseases that can be fatal or may cause temporary or permanent disability. The risks associated with taking oral contraceptives increases simificantly if you:

taking oral contraceptives increase significantly if you:

smoke
have high blood pressure, diabetes, high cholesterol
have or have had clotting disorders, heart attack, stroke, angina pectoris, cancer of the breast or sex organs, jaundice or malignant or benign liver tumors Although cardiovascular disease risks may be increased with oral contraceptive use after age 40 in healthy, non-smoking women (even with the newer low-dose formulations), there are also greater potential health risks associated with pregnancy in older womer

You should not take the pill if you suspect you are pregnant or have unexplained vaginal bleeding.

Cigarette smoking increases the risk of serious cardiovascular side effects from oral contraceptive use. This risk increases with age and with heavy smoking (15 or more cigarettes per day) and is quite marked in women over 35 years of age. Women who use oral contraceptives are strongly advised not to smoke.

Most side effects of the pill are not serious. The most common such effects are nausea, vomiting, bleeding between menstrual periods, weight gain, breast tender-ness, and difficulty wearing contact lenses. These side effects, especially nausea and vomiting, may subside within the first three months of use.

The serious side effects of the pill occur very infrequently, especially if you are in good health and are young. However, you should know that the following medical conditions have been associated with or made worse by the pill:

 Blood clots in the legs (thrombophlebitis), lungs (pulmonary embolism), stop-page or rupture of a blood vessel in the brain (stroke), blockage of blood vessels in the heart (heart attack or angina pectoris) or other organs of the body. As men tioned above, smoking increases the risk of heart attacks and strokes and subse quent serious medical consequences

2. In rare cases, oral contraceptives can cause benign but dangerous liver tumors These benign liver tumors can rupture and cause fatal internal bleeding. In addi-tion, some studies report an increased risk of developing liver cancer. However, liver cancers are rare.

High blood pressure, although blood pressure usually returns to normal when the pill is stopped.

The symptoms associated with these serious side effects are discussed in the detailed leaflet given to you with your supply of pills. Notify your healthcare profes-sional if you notice any unusual physical disturbances while taking the pill. In addition, drugs such as rifampin, bosentan, as well as some anti-convulsants and some antibiotics, and herbal preparations containing St. John's Wort (hypericum perforatum) may decrease oral contraceptive effectiveness.

Oral contraceptives may interact with lamotrigine (LAMICTAL®), an anticonvulsant used for epilepsy. This may increase the risk of seizures so your healthcare pro-fessional may need to adjust the dose of lamotrigine.

fessional may need to adjust the dose of lamotrigine. Various studies give conflicting reports on the relationship between breast cancer and oral contraceptive use. Oral contraceptive use may slightly increase your chance of having breast cancer diagnosed, particularly after using hormonal contracep-tives at a younger age. After you stop using hormonal contraceptives, the chances of having breast cancer diagnosed begin to go back down. You should have regular breast examinations by a healthcare professional and examine your own breasts monthly. Tell your healthcare professional if you have a family history of breast can-cer or if you have had breast cancer should not use oral contraceptives because breast cancer is usually a hormone-sensitive tumor. Some studies have found an increase in the incidence of cancer of the cervix in

Some studies have found an increase in the incidence of cancer of the cervix in women who use oral contraceptives. However, this finding may be related to factors other than the use of oral contraceptives. There is insufficient evidence to rule out the possibility that the pill may cause such cancers

Taking the combination pill provides some important non-contraceptive benefits. These include less painful menstruation, less menstrual blood loss and anemia, fewer pelvic infections, and fewer cancers of the ovary and the lining of the uterus. tever pelvic intections, and tever cancers of the ovary and the lining of the uterus. Be sure to discuss any medical condition you may have with your healthcare pro-fessional. Your healthcare professional will take a medical and family history before prescribing oral contraceptives and will examine you. The physical examination may be delayed to another time if you request it and the healthcare professional believes that it is a good medical practice to postpone it. You should be reexamined at least once a year while taking oral contraceptives. Your pharmacist should have given you the detailed patient information labeling which gives you further information which you should read and discuss with your healthcare professional.

ORTHO TRI-CYCLEN® Lo (like all oral contraceptives) is intended to prevent pregnancy. Oral contraceptives do not protect against transmission of HIV (AIDS) and other sexually transmitted diseases such as chlamydia, genital herpes, genital warts, gonorrhea, hepatitis B, and syphilis.

HOW TO TAKE THE PILL

IMPORTANT POINTS TO REMEMBER

BEFORE YOU START TAKING YOUR PILLS:

1. BE SURE TO READ THESE DIRECTIONS:

Before you start taking your pills. Anytime you are not sure what to do.

- 2. THE RIGHT WAY TO TAKE THE PILL IS TO TAKE ONE PILL EVERY DAY AT THE SAME TIME. If you miss pills you could get pregnant. This includes starting the pack late.
- The more pills you miss, the more likely you are to get pregnant
- MANY WOMEN HAVE SPOTTING OR LIGHT BLEEDING, OR MAY FEEL SICK TO THEIR STOMACH DURING THE FIRST 1-3 PACKS OF PILLS. If you feel sick to your stomach, do not stop taking the pill. The problem will usually go away. If it doesn't go away, check with your healthcare professional.
 MISSING PILLS CAN ALSO CAUSE SPOTTING OR LIGHT BLEEDING, even when uncompared to the the related ability.
- you make up these missed pills. On the days you take 2 pills to make up for missed pills, you could also feel a little sick to your stomach.
- 5. IF YOU HAVE VOMITING OR DIARRHEA, or IF YOU TAKE SOME MEDICINES, including some antibiotics, your pills may not work as well. Use a back-up method (such as condoms or spermicides) until you check with your healthcare professional.
- 6. IF YOU HAVE TROUBLE REMEMBERING TO TAKE THE PILL, talk to your health care professional about how to make pill-taking easier or about using another
- method of birth control 7. IF YOU HAVE ANY QUESTIONS OR ARE UNSURE ABOUT THE INFORMATION IN THIS LEAFLET, call your healthcare professional.

BEFORE YOU START TAKING YOUR PILLS

1. DECIDE WHAT TIME OF DAY YOU WANT TO TAKE YOUR PILL.

- It is important to take it at about the same time every day
- The 28-pill pack has 21 white, light blue, and dark blue "active" pills (with hormones) to take for 3 weeks. This is followed by 1 week of dark green "reminder" pills (without hormones).
- 3 ALSO FIND
- 1) where on the pack to start taking pills, 2) in what order to take the pills
- CHECK PICTURE OF PILL PACK AND ADDITIONAL INSTRUCTIONS FOR USING THIS PACKAGE IN THE BRIEF SUMMARY PATIENT PACKAGE INSERT.
- 4. BE SURE YOU HAVE READY AT ALL TIMES: ANOTHER KIND OF BIRTH CONTROL (such as condoms or spermicide) to use as a back-up method in case you miss pills. AN EXTRA, FULL PILL PACK.

WHEN TO START THE FIRST PACK OF PILLS

You have a choice of which day to start taking your first pack of pills. ORTHO TRI-CYCLEN^e Lo is available in the DIALPAK[®] Tablet Dispenser which is preset for a Sunday Start. Day 1 Start is also provided. Decide with your healthcare profes-sional which is the best day for you. Pick a time of day that will be easy to remember.

Sunday Start: Take the first white "active" pill of the first pack on the <u>Sunday after your period</u> starts, even if you are still bleeding. If your period begins on Sunday, start the pack that same day.

Take your pill at the same time every day. It is important to take the correct pill each day and not miss any pills. To help you remember, take your pill at the same time as another daily activity, like turning off your alarm clock or brushing your teeth.

When your refill is empty, keep your Dialpak case. You will start a new refill on the day after pill "28."

Turn the dial to the pill "1" position to remove the empty refill and insert a new refill. THE FIRST PILL IN EVERY REFILL WILL ALWAYS BE TAKEN ON THE SAME DAY OF THE WEEK, NO MATTER WHEN YOUR NEXT PERIOD STARTS.

DETAILED PATIENT LABELING <u>PLEASE NOTE</u>: This labeling is revised from time to time as important new med-ical information becomes available. Therefore, please review this labeling carefully. **ORTHO TRI-CYCLEN® Lo Tablets**

Each white tablet contains 0.180 mg norgestimate and 0.025 mg ethinyl estradiol. Each light blue tablet contains 0.215 mg norgestimate and 0.025 mg ethinyl estradiol. Each dark blue tablet contains 0.250 mg norgestimate and 0.025 mg ethinyl estradiol. Each dark green tablet contains inert ingredients.

INTRODUCTION

INTRODUCTION Any woman who considers using oral contraceptives (the birth control pill or the pill) should understand the benefits and risks of using this form of birth control. This patient labeling will give you much of the information you will need to make this de-cision and will also help you determine if you are at risk of developing any of the serious side effects of the pill. It will tell you how to use the pill properly so that it will be as effective as possible. However, this labeling is not a replacement for a careful discussion between you and your healthcare professional. You should dis-cuss the information provided in this labeling with him or her, both when you first start taking the pill and during your revisits. You should also flow your healthcare start taking the pill and during your revisits. You should also follow your healthcare professional's advice with regard to regular check-ups while you are on the pill.

EFFECTIVENESS OF ORAL CONTRACEPTIVES FOR CONTRACEPTION

Oral contraceptives or "birth control pills" or "the pill" are used to prevent preg-nancy and are more effective than most other non-surgical methods of birth control. When taken correctly without missing any pills, oral contraceptives are highly effective; however, typical failure rates are 5% per year. The chance of becoming pregnant increases with each missed pill during a menstrual cycle.

In comparison, typical failure rates for other non-surgical methods of birth control during the first year of use are as follows:

Implant: <1%	Cervical Cap with spermicide
Injection: <1%	20 to 40%
IUD: 1 to 2%	Condom alone (male): 14%
Diaphragm with spermicides: 20%	Condom alone (female): 21%
Spermicides alone: 26%	Periodic abstinence: 25%
Vaginal sponge: 20 to 40%	No methods: 85%
Female sterilization: <1%	Withdrawal: 19%
Male sterilization: <1%	

WHO SHOULD NOT TAKE ORAL CONTRACEPTIVES

Cigarette smoking increases the risk of serious cardiovascular side effects from oral contraceptive use. This risk increases with age and with heavy smoking (15 or more cigarettes per day) and is quite marked in women over 35 years of age. Women who use oral contraceptives are strongly advised not to smoke.

Some women should not use the pill. You should not use the pill if you have any of the following conditions

- the following conductors: A history of heart attack or stroke Blood clots in the legs (thrombophlebitis), lungs (pulmonary embolism), or eyes A history of blood clots in the deep veins of your legs Chest pain (angina pectoris) Known or suspected breast cancer or cancer of the lining of the uterus, cervix or
- vagina Unexplained vaginal bleeding (until a diagnosis is reached by your healthcare
- professional) Yellowing of the whites of the eyes or of the skin (jaundice) during pregnancy or
- during previous use of the pill Liver tumor (benign or cancerous)
- Known or suspected pregnancy
- If you plan to have surgery with prolonged bedrest Tell your healthcare professional if you have ever had any of these conditions. Your healthcare professional can recommend a safer method of birth control.
- OTHER CONSIDERATIONS BEFORE TAKING ORAL CONTRACEPTIVES

Fell your healthcare professional if you have or have had

· Breast nodules, fibrocystic disease of the breast, an abnormal breast x-ray or mammogram Diabetes Elevated cholesterol or triglycerides

- Elevated cholesterol or triglycerides
 High blood pressure
 Migraine or other headaches or epilepsy
 Mental depression
 Galibladder, liver, heart or kidney disease
 History of scanty or irregular menstrual periods
- Women with any of these conditions should be checked often by their healthcare professional if they choose to use oral contraceptives

Also, be sure to inform your healthcare professional if you smoke or are on any

RISKS OF TAKING ORAL CONTRACEPTIVES

1. Risk of Developing Blood Clots

Blood clots and blockage of blood vessels are one of the most serious side effects of taking oral contraceptives and can cause death or serious disability. In particu-lar, a clot in the legs can cause thrombophlebitis and a clot that travels to the lungs can cause a sudden blocking of the vessel carrying blood to the lungs. Rarely, clots occur in the blood vessels of the eye and may cause blindness, double vision, or

If you take oral contraceptives and need elective surgery, need to stay in bed for a prolonged illness or injury or have recently delivered a baby, you may be at risk of developing blood clots. You should consult your healthcare professional about stopping oral contraceptives four weeks before surgery and not taking oral con-traceptives for two weeks after surgery or during bed rest. You should also not take oral contraceptives soon after delivery of a baby. It is advisable to wait for at least four weeks after delivery if you are not breastfeeding. If you are breastfeeding, you should wait until you have weaned your child before using the pill. (See also the section on Breastfeeding in General Precautions.) The risk of circulatory disease in oral contraceptive users may be higher in users.

of high-dose pills and may be greater with longer duration of oral contraceptive use. In addition, some of these increased risks may continue for a number of years after stopping oral contraceptives. The risk of abnormal blood clotting increases with age in both users and nonusers of oral contraceptives, but the increased risk from the oral contraceptive appears to be present at all ages. For women aged 20 to 44 it is estimated that about 1 in 2,000 using oral contraceptives will be hospito 44 it is estimated that about 1 in 2,000 using oral contraceptives will be hospi-talized each year because of abnormal clotting. Among nonusers in the same age group, about 1 in 20,000 would be hospitalized each year. For oral contraceptive users in general, it has been estimated that in women between the ages of 15 and 34 the risk of death due to a circulatory disorder is about 1 in 12,000 per year, whereas for nonusers the rate is about 1 in 50,000 per year. In the age group 35 to 44, the risk is estimated to be about 1 in 2,500 per year for oral contraceptive users and about 1 in 10,000 per year for nonusers

2. Heart Attacks and Strokes

 You may not have your period this month but this is expected. However, if you
miss your period 2 months in a row, call your healthcare professional because
you might be pregnant. Oral contraceptives may increase the tendency to develop strokes (stoppage or rupture of blood vessels in the brain) and angina pectoris and heart attack (blockace of blood vessels in the heart). Any of these conditions can cause deat 3. You COULD BECOME PREGNANT if you have sex in the 7 days after you miss pills. You MUST use another birth control method (such as condoms or spern or serious disability Smoking greatly increases the possibility of suffering heart attacks and strokes. Furtherm ore, smoking and the use of oral contraceptives greatly increase the chances of developing and dying of heart disease. 3. Gallbladder Disease Oral contraceptive users probably have a greater risk than nonusers of having gallbladder disease, although this risk may be related to pills containing high do 4. Liver Tumors

oral contraceptives should not be used during pregnancy. You should check with your healthcare professional about risks to your unborn child of any medication taken during pregnancy.

2. While Breastfeeding

If you are breastfeeding, consult your healthcare professional before starting oral nyet are breast local togethy the hear you'r hoannaad protestandrii dwrfi wy far ontraceptiae. Some of the hear you'r be passed on to the child in the milk. A few adverse effects on the child have been reported, including yellowing of the skin (jaundice) and breast enlargement. In addition, oral contraceptives may decrease (Jaundice) and breast enlargement. In addition, oral contraceptives may decrease the amount and quality of your milk. If possible, do not use oral contraceptives while breastfeeding. You should use another method of contraception since breastfeed-ing provides only partial protection from becoming pregnant and this partial pro-tection decreases significantly as you breastfeed for longer periods of time. You should consider starting oral contraceptives only after you have weaned your child completely.

3. Laboratory Tests

If you are scheduled for any laboratory tests, tell your healthcare professional you are taking birth control pills. Certain blood tests may be affected by birth control pills.

4. Drug Interactions

Certain drugs may interact with birth control pills to make them less effective in pre-Certain drugs may interact with birth control plus to make them less effective in pre-venting pregnancy or cause an increase in breakthrough bleeding. Such drugs include rifampin, drugs used for epilepsy such as barbiturates (for example, phenobarbital), topiramate (TOPAMAX[®]), carbamazepine (Tegretol[®] is one brand of this drug), or phenytoin (Dilantin[®] is one brand of this drug); phenylbutazone (Butazolidin[®] is one brand); certain drugs used in the treatment of HIV or AIDS; and possibly certain antibiotics. Medicine for pulmonary hypertension, such as bosentan (Tracleer[®]). Pregnancies and breakthrough bleeding have been reported by women who also used some form of the herbal supplement St. John's Wort while using combined hormonal contracentives. combined hormonal contraceptives. Hormonal contraceptives may interact with lam otrigine (LAMICTAL®), an anticonvulsant used for epilepsy. This may increase the risk of seizures so your healthcare professional may need to adjust the dose of lam-otrigine. You may need to use additional contraception when you take other products which can make oral contraceptives less effective. Be sure to tell your healthcare professional if you are taking or start taking any medications while taking birth con trol pills.

5. Sexually Transmitted Diseases

ORTHO TRI-CYCLEN® Lo (like all oral contraceptives) is intended to prevent pregnancy. Oral contraceptives do not protect against transmission of HIV (AIDS) and other sexually transmitted diseases such as chlamydia, genital herpes, genital warts, gonorrhea, hepatitis B, and syphilis

HOW TO TAKE THE PILL

IMPORTANT POINTS TO REMEMBER

- BEFORE YOU START TAKING YOUR PILLS:
- BE SURE TO READ THESE DIRECTIONS: Before you start taking your pills. Anytime you are not sure what to do.

- If you forget any of the 7 dark green "reminder" pills in Week 4

THROW AWAY the pills you missed.

Keep taking 1 pill each day until the pack is empty.

You do not need a back-up method.

FINALLY, IF YOU ARE STILL NOT SURE WHAT TO DO ABOUT THE PILLS YOU HAVE MISSED:

Use a BACK-UP METHOD anytime you have sex.

KEEP TAKING ONE "ACTIVE" PILL EACH DAY until you can reach your healthcare

INSTRUCTIONS FOR USING YOUR DIALPAK® TABLET DISPENSER

Sunday Start or Day 1 Start

There are two ways to start taking birth control pills: Sunday Start or Day 1 Start.

Start.

Your healthcare provider will tell you which to use. Save these instructions.

Sunday Start

🗆 Day 1 Start

When you get your period: You will use a Sunday Start if your doctor told you to take your first pill on a Sunday. Take pill "1" on the Sunday after your period starts.
 If your period starts on a Sunday, take pill "1" that day.
 You will use a Day 1 Start if your doctor told you to take pill "1" and the first day of your period. to take pill "1" on the first day of your period.

If this is the first time you are taking birth control

pills, or if you have not taken birth control pills for 10 days or more, your first step is to wait until the first day you get your menstrual period. Then, follow these instructions for either Sunday Start or Day 1

∠Dia**l**pak SET THE DAY:

Sunday Start: the arrow on your empty Dialpak should point to SU (Sunday). **Day 1 Start:** turn the dial on your *empty* Dialpak until the arrow points to the first day of your period (if your period starts on Tuesday, the arrow will point to TU).

Insert the new refill by lining up the "V" shape on the refill with the "V" shape at the top of your Dialpak. Snap the refill in place. You are ready to take pill "1." You should always begin your pill cycle with pill "1," as shown on the inner part of the refill ring.

Remove pill "1" by pushing down on the pill. The pill will come out through a hole in the back of the Dialpak

Swallow the pill. You will take one pill each day. If you use a Sunday Start and you are taking the pill for the FIRST TIME, YOU MUST USE A BACK-UP METHOD OF BIRTH CONTROL FOR THE FIRST 7 DAYS. If you use a Day 1 Start, you are protected fro becoming pregnant as soon as you take your first pill

Wait 24 hours to take your next pill. To take pill "2," turn the dial on your Dialpak to the next day Continue to take one pill each day until all the pills

have been taken

In rare cases, oral contraceptives can cause benign but dangerous liver tumors. These benign liver tumors can rupture and cause fatal internal bleeding. In addition, some studies report an increased risk of developing liver cancer. However liver cancers are rare 5. Cancer of the Reproductive Organs and Breasts

5. Cancer of the Reproductive Organs and Breasts Various studies give conflicting reports on the relationship between breast cancer and oral contraceptive use. Oral contraceptive use may slightly increase your chance of having breast cancer diagnosed, particularly after using hormonal contracep-tives at a younger age. After you stop using hormonal contraceptives, the chances of having breast cancer diagnosed begin to go back down. You should have regular breast examinations by a healthcare professional and examine your own breasts monthly. Tell your healthcare professional if you have a family history of breast cancer or if you have had breast cancer should not use oral contraceptives because breast cancer is usually a hormone-sensitive tumor.

Some studies have found an increase in the incidence of cancer of the cervix in women who use oral contraceptives. However, this finding may be related to factors other than the use of oral contraceptives. There is insufficient evidence to rule out the possibility that the pill may cause such cancers.

ESTIMATED RISK OF DEATH FROM A BIRTH CONTROL METHOD OR

All methods of birth control and pregnancy are associated with a risk of develop-ing certain diseases which may lead to disability or death. An estimate of the number of deaths associated with different methods of birth control and pregnancy has been calculated and is shown in the following table.

Table 4: Annual Number of Birth-Related or Method-Related Death
Associated with Control of Fertility Per 100,000 Nonsterile
Women By Fertility-Control Method and According to Age

Method of control and outcome	15-19	20-24	25-29	30-34	35-39	40-44
No fertility- control methods*	7.0	7.4	9.1	14.8	25.7	28.2
Oral contraceptives nonsmoker**	0.3	0.5	0.9	1.9	13.8	31.6
Oral contraceptives smoker**	2.2	3.4	6.6	13.5	51.1	117.2
IUD**	0.8	0.8	1.0	1.0	1.4	1.4
Condom*	1.1	1.6	0.7	0.2	0.3	0.4
Diaphragm/spermicide*	1.9	1.2	1.2	1.3	2.2	2.8
Periodic abstinence*	2.5	1.6	1.6	1.7	2.9	3.6

Deaths are birth-related *Deaths are method-related

Adapted from H.W. Ory, Family Planning Perspectives, Ref. #35.

In the above table, the risk of death from any birth control method is less than the risk of childbirth, except for oral contraceptive users over the age of 35 who smoke and pill users over the age of 40 even if they do not smoke. It can be seen in the table that for women aged 15 to 39, the risk of death was highest with pregnancy table that for women aged 15 to 39, the risk of death was highest with pregnancy (7-26 deaths per 100,000 women, depending on age). Among pill users who do not smoke, the risk of death was always lower than that associated with pregnancy for any age group, although over the age of 40, the risk increases to 32 deaths per 100,000 women, compared to 28 associated with pregnancy at that age. However, for pill users who smoke and are over the age of 35, the estimated number of deaths exceeds those for other methods of birth control. If a woman is over the age of 40 and smokes, her estimated risk of death is four times higher (117/100,000 women) than the estimated risk associated with pregnancy (28/100,000 women) in that age group. age group

The suggestion that women over 40 who do not smoke should not take oral conves is based on information from older, higher-dose pills. An Advisory tracepti Committee of the FDA discussed this issue in 1989 and recommended that the benefits of low-dose oral contraceptive use by healthy, non-smoking women over 40 years of age may outweigh the possible risks. Older women, as all women, who take oral contraceptives, should take an oral contraceptive which contains the least amount of estrogen and progestogen that is compatible with the individual actient post.

WARNING SIGNALS

If any of hese adverse effects occur while you are taking oral contraceptives, call your healthcare professional immediately:

- Sharp chest pain, coughing of blood, or sudden shortness of breath (indicating a possible clot in the lung

- a possible clot in the lung)
 Pain in the calf (indicating a possible clot in the leg)
 Crushing chest pain or heaviness in the chest (indicating a possible heart attack)
 Sudden severe headache or vomiting, dizziness or fainting, disturbances of vision or speech, weakness, or numbness in a nær or leg (indicating a possible clot in the eye)
 Sudden partial or complete loss of vision (indicating a possible clot in the eye)
 Breast lumps (indicating possible breast cancer or fibrocystic disease of the breast; ask your healthcare professional to show you how to examine your breasts)
 Severe pain or tenderness in the stomach area (indicating a possibly ruptured liver tumor)
 Difficulty in sleeping, weakness, lack of energy, fatigue, or change in mood (possibly indicating severe depression)
 Jaundice or a yellowing of the skin or eyeballs, accompanied frequently by fever, fatigue, loss of appetite, dark colored urine, or light colored bowel movements (indicating possible liver problems)
 SIDE EFFECTS OF ORAL CONTRACEPTIVES

SIDE EFFECTS OF ORAL CONTRACEPTIVES

Irregular vaginal bleeding or spotting may occur while you are taking the pills. Irregular vaginal bleeding or spotting may occur while you are taking the pills. Irregular bleeding may vary from slight staining between menstrual periods to break-through bleeding which is a flow much like a regular period. Irregular bleeding occurs most often during the first few months of oral contraceptive use, but may also occur after you have been taking the pill for some time. Such bleeding may be temporary and usually does not indicate any serious problems. It is important to continue taking your pills on schedule. If the bleeding occurs in more than one cycle or lasts for more than a few days, talk to your healthcare professional. 2. Contact Lenses

If you wear contact lenses and notice a change in vision or an inability to wear your lenses, contact your healthcare professional.

3. Fluid Retention

Oral contraceptives may cause edema (fluid retention) with swelling of the fingers or ankles and may raise your blood pressure. If you experience fluid retention, contact your healthcare professional. 4 Melasma

A spotty darkening of the skin is possible, particularly of the face, which may persist 5. Other Side Effects

Other side effects may include nausea and vomiting, change in appetite, headache, nervousness, depression, dizziness, loss of scalp hair, rash, vaginal infections, and allergic reactions

If any of these side effects bother you, call your healthcare professional

GENERAL PRECAUTIONS . Missed Periods and Use of Oral Contraceptives Before or During Early

There may be times when you may not menstruate regularly after you have completed taking a cycle of pills. If you have taken your pills regularly and miss one menstrual period, continue taking your pills for the next cycle but be sure to inform your healthcare professional. If you have not taken the pills daily as instructed and missed a menstrual period, you may be pregnant. If you missed two consecutive menstrual periods, you may be pregnant. Check with your healthcare professional immediately to determine whether you are pregnant. Stop taking oral contraceptives if pregnancy is confirmed.

There is no conclusive evidence that oral contraceptive use is associ increase in birth defects, when taken inadvertently during early pregnancy. Previously, a few studies had reported that oral contraceptives might be associated with birth defects, but these findings have not been seen in more recent studies. Nevertheless

cide) as a back-up method for those 7 days. f you MISS 3 OR MORE white, light blue or dark blue "active" pills in a row (during

the first 3 weeks) 1 If you are a Sunday Starter:

public libraries.

OTHER INFORMATION

FINALLY, IF YOU ARE STILL NOT SURE WHAT TO DO ABOUT THE PILLS YOU HAVE MISSED

Use a BACK-UP METHOD anytime you have sex.

KEEP TAKING ONE "ACTIVE" PILL EACH DAY until you can reach your healthcare

PREGNANCY DUE TO PILL FAILURE When taken correctly without missing any pills, oral contraceptives are highly effective; however the typical failure rate of large numbers of pill users is 5% per year when women who miss pills are included. If failure does occur, the risk to the characteristical.

PREGNANCY AFTER STOPPING THE PILL There may be some delay in becoming pregnant after you stop using oral contra-ceptives, especially if you had irregular menstrual cycles before you used oral con-traceptives. It may be advisable to postpone conception until you begin menstruating regularly once you have stopped taking the pill and desire pregnancy.

There does not appear to be any increase in birth defects in newborn babies when

Serious ill effects have not been reported following ingestion of large doses of oral contraceptives by young children. Overdosage may cause nausea and withdrawal bleeding in females. In case of overdosage, contact your healthcare professional

sional will take a medical and family history before pre-

ion oral contraceptives may

OTHER INFORMATION Your healthcare professional will take a medical and family history before pre-scribing oral contraceptives and will examine you. The physical examination may be delayed to another time if you request it and the healthcare professional believes that it is a good medical practice to postpone it. You should be reexamined at least once a year. Be sure to inform your healthcare professional if there is a family his-tory of any of the conditions listed previously in this leaflet. Be sure to keep all ap-pointments with your healthcare professional, because this is a time to determine if there are early signs of side effects of oral contraceptive use.

Do not use the drug for any condition other than the one for which it was prescribed.

This drug has been prescribed specifically for you; do not give it to others who may want birth control pills.

menstrual cycles may become more regular
blood flow during menstruation may be lighter and less iron may be lost. Therefore, anemia due to iron deficiency is less likely to occur

pain or other symptoms during menstruation may be encountered less frequently

actopic (tabla) pegnalary may occur less inequently
 acute pelvic inflammatory disease may occur less frequently
 acute pelvic inflammatory disease may occur less frequently
 oral contraceptive use may provide some protection against developing two forms of cancer: cancer of the ovaries and cancer of the lining of the uterus
