

NDC XXXXX-XXX-XX

Tinidazole Tablets

250 mg

Only 40 Tablets

Reference ID: 3297368

Each film-coated tablet contains:
Tinidazole USP 250 mg

Usual Dosage: See accompanying Prescribing Information

Store at controlled room temperature, 20-25°C (68-77°F);
excursions permitted to 15-30°C (59-86°F) [see USP].
Protect contents from light.

WARNING: As with all medications, keep out of reach of children.

glucose. Values of zero may be observed. All of the assays in which interference has been reported involve enzymatic coupling of the assay to oxidon reduction of nicotinamide adenine dinucleotide (NAD⁺ to NADH). Potential interference is due to the similarity of absorbance peaks of NADH and indazole. Tridazole, like me nitroimidazole, may produce transient leukopenia and neutropenia; however, no persistent hematological abnormalities attributable to indazole have been observed in clinical studies. Total and differential leukocyte counts are recommended if no treatment is necessary.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Teratogenic effects: Pregnancy Category C

The use of indazole in pregnant patients has not been studied. Since tridazole crosses the placental barrier and enters fetal circulation it should not be administered to pregnant patients in the first trimester. Embryo/fetal developmental toxicity studies in pregnant mice indicated no embryo/fetal toxicity or malformations at the highest dose level of 2,500 mg/kg (approximately 6.3 fold the highest human therapeutic dose based upon body surface area conversions). In a study with pregnant rats a slightly higher incidence of fetal mortality was observed at a maternal dose of 500 mg/kg (2.5 fold the highest human therapeutic dose based upon body surface area conversions). No biological relevant neonatal developmental effects were observed in rats neonates following maternal doses as high as 600 mg/kg (3 fold the highest human therapeutic dose based upon body surface area conversions). Although there is some evidence of mutagenic potential and animal reproduction studies are not always predictive of human response, the use of indazole after the first trimester of pregnancy requires that the potential benefit of the drug be weighed against the possible risks to both the mother and the fetus.

8.3 Nursing Mothers

Tridazole is excreted in breast milk in concentrations similar to those seen in serum. Tridazole can be detected in breast milk for up to 72 hours following administration. Interruption of breastfeeding is recommended during tridazole therapy and for 3 days following the last dose.

8.4 Pediatric Use

Other than use in the treatment of giardiasis and amebiasis in pediatric patients older than three years of age, safety and effectiveness of indazole in pediatric patients have not been established.

Pediatric Administration: For those unable to swallow tablets, tridazole tablets may be crushed in artificial cherry syrup, or taken with food [See Dosage and Administration (2.2)].

8.5 Geriatric Use

Clinical studies of indazole did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. In general, dose selection for an elderly patient should be cautious, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

8.6 Renal Impairment

Because the pharmacokinetics of indazole in patients with severe renal impairment (CrCl < 22 mL/min) are not significantly different from those in healthy subjects, no dose adjustments are necessary in these patients.

Patients undergoing hemodialysis: If indazole is administered on the same day as prior hemodialysis, it is recommended that an additional oral dose of indazole equivalent to one half of the recommended dose be administered after the end of the hemodialysis [See Clinical Pharmacology (12.3)].

8.7 Hepatic Impairment

There are no data on indazole pharmacokinetics in patients with impaired hepatic function. Reduced elimination of metronidazole, a chemically related nitroimidazole, has been reported in this population. Usual recommended doses of indazole should be administered cautiously in patients with hepatic dysfunction [See Clinical Pharmacology (12.3)].

10 OVERDOSAGE

There are no reported overdoses with indazole in humans. In a study of overdosage with indazole, therefore, treatment should be symptomatic and supportive. Gastric lavage may be helpful. Hemodialysis can be considered because approximately 43% of the amount present in the body is in plasma at during a 6-hour hemodialysis session.

11 DESCRIPTION

Tridazole is a synthetic antiprotozoal and antibacterial agent. It is 1 (2-ethyl-5-ylthio) 2-methyl-5-nitroimidazole, a second generation 2-methyl-5-nitroimidazole, which has the following chemical structure:

Tridazole pink oral tablets contain 250 mg or 500 mg of indazole. Inactive ingredients include microcrystalline cellulose, croscarmellose sodium, pregelatinized starch, magnesium stearate, hypromellose, titanium dioxide, polyethylene glycol, triacetin, FD&C Red #40, FD&C Yellow #3.

CLINICAL PHARMACOLOGY

12 Mechanism of Action

Tridazole is an antiprotozoal and antibacterial agent [See Clinical Pharmacology (12.4)].

12.3 Pharmacokinetics

Absorption: After oral administration, indazole is rapidly and completely absorbed. A bioavailability study of tridazole tablets was conducted in adult healthy volunteers. All subjects received a single oral dose of 2 g (four 500 mg tablets) of tridazole tablets following an overnight fast. Oral administration of four 500 mg tablets of tridazole tablets under fasted conditions produced a mean peak plasma concentration (C_{max}) of 47.7 ± 7.5 µg/mL with a mean time to peak concentration (T_{max}) of 1.6 ± 0.7 hours, and a mean area under the plasma concentration-time curve (AUC, 0-∞) of 901.6 ± 126.5 µg·h/mL at 72 hours. The elimination half-life (T_{1/2}) was 13.2 ± 4.1 hours. Mean plasma levels decreased to 0.14 µg/mL at 24 hours, 3.8 µg/mL at 48 hours and 0.8 µg/mL at 72 hours following administration. Steady state conditions are reached in 2½–3 days of multi-day dosing.

Administration: Tridazole Tablets with food resulted in a delay in T_{max} of approximately 2 hours and a decline in C_{max} of approximately 10%, compared to fasted conditions. However, administration of tridazole tablets with food did not affect AUC or T_{1/2} in this study. In healthy volunteers, administration of crushed tridazole tablets in artificial cherry syrup, prepared as described in Dosage and Administration (2.2) [after an overnight fast had no effect on any pharmacokinetic parameter as compared to tablets swallowed whole under fasted conditions].

Distribution: Tridazole is distributed into various body fluids and also crosses the blood-brain barrier. The apparent volume of distribution is about 50 liters. Plasma protein binding of indazole is 12%. Tridazole crosses the placental barrier and is secreted in breast milk.

Metabolism: Tridazole is significantly metabolized in humans prior to excretion. Tridazole is primarily metabolized by oxidation, hydroxylation, and conjugation. Tridazole is the major drug metabolite excreted in plasma after human treatment, along with a small amount of the 2-hydroxymethyl metabolite. Tridazole is biotransformed mainly by CYP3A4. In an in vitro metabolic drug interaction study, tridazole concentrations of up to 75 µg/mL did not inhibit the enzyme activities of CYP1A2, CYP2B6, CYP2C8, CYP2D6, CYP2E1, CYP3A4, and CYP3A4.

The potential of indazole to inhibit the metabolism of other drugs has not been evaluated. **Elimination:** The plasma half-life of indazole is approximately 12–14 hours. Tridazole is excreted by the liver and the kidneys. Tridazole is excreted in the urine mainly as unchanged drug (approximately 20–25% of the administered dose). Approximately 12% of the drug is excreted in the feces.

Patients with impaired renal function: The pharmacokinetics of indazole in patients with severe renal impairment (CrCl < 22 mL/min) are not significantly different from the pharmacokinetics seen in healthy subjects. However, during hemodialysis, clearance of indazole is significantly increased, the half-life is reduced from 12–14 hours to 4–9 hours. Approximately 43% of the amount present in the body is eliminated during a 6-hour

hemodialysis session [See Use in Specific Populations (8.6)]. The pharmacokinetics of indazole in patients undergoing routine continuous peritoneal dialysis have not been investigated. **Patients with impaired hepatic function:** There are no data on tridazole pharmacokinetics in patients with impaired hepatic function. Reduction of metabolic elimination of metronidazole, a chemically related nitroimidazole, in patients with hepatic dysfunction has been reported in several studies [See Use in Specific Populations (8.7)].

12.4 Microbiology

Mechanism of Action: Tridazole is an antiprotozoal and antibacterial agent. The nitro group of indazole is reduced by cell extracts of Trichomonas. The free nitro radical generated as a result of this reduction may be responsible for the antiprotozoal activity. Chemically reduced indazole was shown to release nitrites and cause damage to purified bacterial DNA in vitro.

Additively, the drug caused DNA base changes in bacterial cells and DNA strand breakage in mammalian cells. The mechanism by which tridazole exhibits activity against Giardia and Entamoeba species is unknown. **Antibacterial:** Culture and sensitivity testing of bacteria are not routinely performed to establish the diagnosis of bacterial vaginosis [See Indications and Usage (1.4)]. Standard methodology for the susceptibility testing of potential bacterial pathogens, Gardnerella vaginalis, Mobiluncus spp., or Mycoplasma hominis, has not been determined. The following in vitro data are available, but their clinical significance is unknown. Tridazole is active in vitro against most strains of the following organisms that have been reported to be associated with bacterial vaginosis: Bacteroides spp., Gardnerella vaginalis, Prevotella spp.

Tridazole does not appear to have activity against most strains of vaginal lactobacilli. Antiprotozoal: Tridazole demonstrates activity both in vitro and in clinical infections against the following protozoa: Trichomonas vaginalis, Giardia duodenalis (also termed G. lamblia), and Entamoeba histolytica.

For protozoal parasites, standardized susceptibility tests do not exist for use in clinical microbiology laboratories. **Drug Resistance:** The development of resistance to indazole by G. duodenalis, E. histolytica, or bacteria associated with bacterial vaginosis has not been examined. Cross resistance: Approximately 38% of G. vaginalis isolates exhibiting reduced susceptibility to metronidazole also show reduced susceptibility to indazole in vitro. The clinical significance of such an effect is not known.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Metronidazole, a chemically related nitroimidazole, has been reported to be carcinogenic in mice and rats but not hamsters. In several studies, high doses of metronidazole showed evidence of pulmonary, hepatic, and lymphatic tumorigenesis in mice and mammary and hepatic tumors in female rats. Tridazole carcinogenicity studies in mice, rats, or hamsters have not been reported. Tridazole was mutagenic in the TA 100, TA 5, and Sphingomonas test strains both with and without the metabolic activation system and was negative for mutagenicity in the TA 98 strain. Mutagenicity results were mixed (positive and negative) in the TA 1535, 1537, and 1538 strains. Tridazole was also mutagenic in a tester strain of Klebsiella pneumoniae. Tridazole was negative for mutagenicity in a mammalian cell culture system using Chinese hamster lung V79 cells (HGPRT⁺ test system) and negative for genotoxicity in the Chinese hamster ovary (CHO) sister chromatid exchange assay. Tridazole was positive for in vivo genotoxicity in the mouse micronucleus assay.

In a 60-day fertility study, tridazole reduced fertility and produced testicular/histopathology in male rats at a 600 mg/kg/day dose level (approximately 3 fold the highest human therapeutic dose based upon body surface area conversions). Spermatogenic effects resulted from 300 and 600 mg/kg/day dose levels. The no observed adverse reaction level for testicular and spermatogenic effects was 100 mg/kg/day (approximately 0.5 fold the highest human therapeutic dose based upon body surface area conversions). This is the lowest chronic toxic effect of agents in the 5-nitroimidazole class.

13.2 Animal Toxicology and/or Pharmacology

In acute studies with mice and rats, the LD₅₀ for mice was generally > 3,600 mg/kg for oral administration and was > 2,300 mg/kg for intraperitoneal administration. In rats, the LD₅₀ was > 2,000 mg/kg for both oral and intraperitoneal administration. A repeated dose toxicity study has been performed in beagle dogs using oral dosing of indazole at 100 mg/kg/day, 300 mg/kg/day, and 600 mg/kg/day for 28 days. On Day 14 of the study, the highest dose was lowered to 600 mg/kg/day due to severe clinical symptoms. The two compound-related effects observed in the dogs treated with indazole were increased atrophy of the thymus in both sexes at the middle and high doses, and atrophy of the prostate at all doses in the males. A no adverse effect level (NOAEL) of 100 mg/kg/day for females was determined. There was no NOAEL identified for males because of minimal atrophy of the prostate at 100 mg/kg/day (approximately 0.5 fold the highest human dose based upon plasma AUC comparisons).

14 CLINICAL STUDIES

14.1 Trichomoniasis

Tridazole (2 g single oral dose) use in trichomoniasis has been well documented in 34 published reports from the world literature involving over 2,800 patients treated with indazole. In four published, blinded, randomized, comparative studies of the 2 g indazole single oral dose where efficacy was assessed by culture at time points post treatment ranging from one week to one month, reported cure rates ranged from 92% (37/40) to 100% (65/65) (n=172 total subjects). In four published, blinded, randomized, comparative studies where efficacy was assessed by wet mount between 7–14 days post treatment, reported cure rates ranged from 80% (8/10) to 100% (16/16) (n=116 total subjects). In these studies, indazole was superior or comparable to other antitrichomonal drugs. The single oral 2 g indazole dose was also assessed in four open-label trials in men in comparative to metronidazole and 3 single arm studies. Parasitological evaluation of the urine was performed both pre and post treatment and reported cure rates ranged from 83% (25/30) to 100% (80/80) (n=142 total subjects).

14.2 Giardiasis

Tridazole (2 g single dose) use in giardiasis has been documented in 19 published reports from the world literature involving over 1,600 patients (adults and pediatric patients). In eight controlled studies involving a total of 619 subjects, of whom 259 were given the 2 g × 1 day (50 mg/kg × 1 day in pediatric patients) oral dose of indazole, reported cure rates ranged from 80% (40/50) to 100% (15/15). In three of these trials where the comparison was 2 to 3 days of various doses of metronidazole, reported cure rates for metronidazole were 76% (19/25) to 95% (14/15). Data comparing a single 2 g dose of indazole to usually recommended 5–7 days of metronidazole are limited.

14.3 Intestinal Amebiasis

Tridazole use in intestinal amebiasis has been documented in 26 published reports from the world literature involving over 1,400 patients. Most reports utilized tridazole 2 g/day × 3 days. In four published, randomized, controlled studies (1 investigator single blind, 3 open label) of the 2 g/day × 3 days oral dose of indazole, reported cure rates after 3 days of therapy among a total of 220 subjects ranged from 86% (26/28) to 83% (25/27).

14.4 Amebic Liver Abscess

Tridazole use in amebic liver abscess has been documented in 18 published reports from the world literature involving over 470 patients. Most reports utilized tridazole 2 g/day × 2–5 days. In seven published, randomized, controlled studies (1 double blind, 1 single blind, 5 open label) of the 2 g/day × 2–5 days oral dose of indazole accompanied by aspiration of the liver abscess when clinically necessary, reported cure rates among 133 subjects ranged from 81% (17/21) to 100% (18/18). Four of these studies lasted at least 5 days of indazole.

14.5 Bacterial Vaginosis

Randomized, double-blind, placebo-controlled clinical trial in 235 non-pregnant women was conducted to evaluate the efficacy of indazole for the treatment of bacterial vaginosis. A clinical diagnosis of bacterial vaginosis was based on Amsel's criteria and defined by the presence of an abnormal homogeneous vaginal discharge that (a) has a pH of greater than 4.5, (b) emits a "fishy" amine odor when mixed with a 10% KOH solution, and (c) contains ≥ 20% cells on microscopic examination. Clinical cure required a return to normal vaginal discharge and resolution of Amsel's criteria. A microbiologic diagnosis of bacterial vaginosis was based on Gram stain of the vaginal smear demonstrating (a) markedly reduced or absent lactobacilli morphology, (b) predominance of Gardnerella morphology,

and (c) absent or few white blood cells, with quantification of these bacterial morphotypes to determine the Nugent score, where a score ≥ 4 was required for study inclusion and a score of 0–3 considered a microbiologic cure. Therapy to cure was a composite endpoint consisting of both a clinical cure and microbiologic cure. In patients with all four Amsel's criteria and with a baseline Nugent score ≥ 4, indazole oral tablets given as either 2 g once daily for 2 days or 1 g once daily for 5 days demonstrated superior efficacy over placebo tablets as measured by therapeutic cure, clinical cure, and a microbiologic cure.

Table 2. Efficacy of Tridazole Tablets in the Treatment of Bacterial Vaginosis in a Randomized, Double-Blind, Double-Dummy, Placebo-Controlled Trial: Modified Intent to Treat Population (n=227)

Outcome	Tridazole Tablets 1g x 5 days (n=78)	Tridazole Tablets 2g x 2 days (n=78)	Placebo (n=78)
	% Cure	% Cure	% Cure
Therapeutic Cure Difference ^a 97.5% CI ^b	36.8 31.7 (16.8, 46.6)	27.4 22.3 (8.0, 36.6)	5.1
Clinical Cure Difference ^a 97.5% CI ^b	51.3 39.8 (23.3, 56.3)	35.6 24.1 (7.8, 40.3)	11.5
Nugent Score Cure Difference ^a 97.5% CI ^b	38.2 33.1 (18.1, 48.0)	27.4 22.3 (8.0, 36.6)	

Modified Intent to Treat of Indazole as a Patient Randomized with a Baseline

Nugent score of at least 4

^a Difference in % cure for indazole (Tridazole Table 2 placebo)

^b 95% confidence interval

p values for both Tridazole regimens vs placebo for therapeutic, clinical, and Nugent score cure rates for both 2 and 5 days < 0.001

The therapeutic cure rate as reported in this clinical study conducted with Tridazole were based on resolution of 4 out of 4 Amsel's criteria and a Nugent score of < 4. The cure rates for previous clinical studies with other products approved for bacterial vaginosis were based on resolution of either 2 or 3 out of 4 Amsel's criteria. At the time of approval for other products for bacterial vaginosis, there was no requirement for a Nugent score on Gram stain, resulting in higher reported rates of cure for bacterial vaginosis for those products than for those reported here for indazole.

16 HOW SUPPLIED/STORAGE AND HANDLING

Tridazole Tablets 250 mg are pink, circular, film-coated scored tablets, with "T" debossed on one side and "500 mg" on the other, supplied in bottles with child-resistant caps as NDC 67668 181 40. Bottle of 40. Tridazole Tablets 500 mg are pink, capsule-shaped, film-coated scored tablets, with "T" debossed on one side and "500 mg" on the other, supplied in bottles with child-resistant caps as NDC 67668 182 20. Bottle of 20. NDC 67668 182 20. Bottle of 20. Storage: Store at controlled room temperature 20°–25° (68°–77° F); excursions permitted to 15°–30° (59°–86° F) [See USP Controlled Room Temperature].

17 PATIENT COUNSELING INFORMATION

17.1 Administration of Drug

Patients should be told to take Tridazole Tablets with food to minimize the incidence of epigastric discomfort and other gastrointestinal side effects. Food does not affect the oral bioavailability of indazole.

17.2 Alcohol Avoidance: Patients should be told to avoid alcoholic beverages and preparations containing ethanol or propylene glycol during tridazole therapy and for 3 days afterward because abdominal cramps, nausea, vomiting, headaches, and flushing may occur.

17.3 Drug Resistance

Patients should be counseled that antibacterial drugs including Tridazole Tablets should only be used to treat bacterial infections. They do not treat viral infections (e.g., the common cold). When Tridazole Tablets are prescribed to treat a bacterial infection, patients should be told that although it is common to feel better early in the course of therapy, the medication should be taken exactly as directed. Skipping doses or not completing the full course of therapy may (1) decrease the effectiveness of the immediate treatment and (2) increase the likelihood that bacteria will develop resistance and will not be treatable by Tridazole Tablets or other antibacterial drugs in the future.
