ELLA (ulipristal acetate) tablet
Initial U.S. Approval: 2010

--- RECENT MAJOR CHANGES ---
- Warnings and Precautions, CYP3A4 Inducers (5.4) 6/2014

--- INDICATIONS AND USAGE ---
ella is a progestosterone agonist/antagonist emergency contraceptive indicated for prevention of pregnancy following unprotected intercourse or a known or suspected contraceptive failure. ella is not intended for routine use as a contraceptive. (1)

--- DOSAGE AND ADMINISTRATION ---
- One tablet taken orally as soon as possible within 120 hours (5 days) after unprotected intercourse or a known or suspected contraceptive failure. (2)
- The tablet can be taken with or without food. (2)

--- DOSAGE FORMS AND STRENGTHS ---
- 30 mg tablet (3)

--- CONTRAINDICATIONS ---
- Known or suspected pregnancy (4)

--- WARNINGS AND PRECAUTIONS ---
- ella is not indicated for termination of an existing pregnancy. Exclude pregnancy before administering. (5.1)
- Ectopic pregnancy: Women who become pregnant or complain of lower abdominal pain after taking ella should be evaluated for ectopic pregnancy. (5.2)
- Effect on menstrual cycle: ella may alter the next expected menses. If menses is delayed beyond 1 week, pregnancy should be ruled out. (5.5)
- ella does not protect against STI/HIV. (5.6)

--- ADVERSE REACTIONS ---
The most common adverse reactions (≥ 5%) in the clinical trials were headache (18%), abdominal pain (12%), nausea (12%), dysmenorrhea (9%), fatigue (6%) and dizziness (5%). (6)

--- USE IN SPECIFIC POPULATIONS ---
- Drugs or herbal products that induce CYP3A4 decrease the effectiveness of ella. (7)
- Nursing mothers: ella is not recommended for use by breastfeeding women. (8.3)
- ella is not intended for use in premenarcheal (8.4) or postmenopausal women. (8.5)

See 17 for PATIENT COUNSELING INFORMATION and FDA Approved Patient Labeling

Revised: 6/2014
If vomiting occurs within 3 hours of **ella** intake, consideration should be given to repeating the dose.

**ella** can be taken at any time during the menstrual cycle.

### 3 DOSAGE FORMS AND STRENGTHS

The **ella** tablet is supplied as a white to off-white, round, curved tablet containing 30 mg of ulipristal acetate and is marked “**ella**” on both sides.

### 4 CONTRAINDICATIONS

**ella** is contraindicated for use in the case of known or suspected pregnancy. The risks to a fetus when **ella** is administered to a pregnant woman are unknown. If this drug is inadvertently used during pregnancy, the woman should be apprised of the potential hazard to the fetus. [See Use in Specific Populations (8.1).]

### 5 WARNINGS AND PRECAUTIONS

#### 5.1 Existing Pregnancy

**ella** is not indicated for termination of an existing pregnancy. Pregnancy should be excluded before prescribing **ella**. If pregnancy cannot be excluded on the basis of history and/or physical examination, pregnancy testing should be performed. A follow-up physical or pelvic examination is recommended if there is any doubt concerning the general health or pregnancy status of any woman after taking **ella**.

#### 5.2 Ectopic Pregnancy

A history of ectopic pregnancy is not a contraindication to use of this emergency contraceptive method. Healthcare providers, however, should consider the possibility of ectopic pregnancy in women who become pregnant or complain of lower abdominal pain after taking **ella**. A follow-up physical or pelvic examination is recommended if there is any doubt concerning the general health or pregnancy status of any woman after taking **ella**.

#### 5.3 Repeated Use

**ella** is for occasional use as an emergency contraceptive. It should not replace a regular method of contraception. Repeated use of **ella** within the same menstrual cycle is not recommended, as safety and efficacy of repeat use within the same cycle has not been evaluated.

#### 5.4 CYP3A4 Inducers

A CYP3A4 inducer, rifampin, decreases the plasma concentration of **ella** significantly. **Ella** should not be administered with CYP3A4 inducers [see Drug interactions (7.1) and Pharmacokinetics (12.3)].

#### 5.5 Fertility Following Use

A rapid return of fertility is likely following treatment with **ella** for emergency contraception; therefore, routine contraception should be continued or initiated as soon as possible following use of **ella** to ensure ongoing prevention of pregnancy. While there are no data about use of **ella** with regular hormonal contraceptives, due to its high affinity binding to the progesterone receptor, use of **ella** may reduce the contraceptive action of regular hormonal contraceptive methods. Therefore, after use of **ella**, a reliable barrier method of contraception should be used with subsequent acts of intercourse that occur in that same menstrual cycle.

#### 5.6 Effect on Menstrual Cycle

After **ella** intake, menses sometimes occur earlier or later than expected by a few days. In clinical trials, cycle length was increased by a mean of 2.5 days but returned to normal in the subsequent cycle. Seven percent of subjects reported menses occurring more than 7 days earlier than expected, and 19% reported a delay of more than 7 days. If there is a delay in the onset of expected menses beyond 1 week, rule out pregnancy.

Nine percent of women studied reported intermenstrual bleeding after use of **ella**.

Reference ID: 3523922
5.7 Sexually Transmitted Infections/HIV

ella does not protect against HIV infection (AIDS) or other sexually transmitted infections (STIs).

6 ADVERSE REACTIONS

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

ella was studied in an open-label multicenter trial (Open-Label Study) and in a comparative, randomized, single-blind, multicenter trial (Single-Blind Comparative Study). In these studies, a total of 2,637 (1,533 + 1,104) women in the 30 mg ulipristal acetate groups were included in the safety analysis. The mean age of women who received ulipristal acetate was 24.5 years and the mean body mass index (BMI) was 25.3. The racial demographics of those enrolled were 67% Caucasian, 20% Black or African American, 2% Asian, and 12% other.

The most common adverse reactions (≥ 10%) in the clinical trials for women receiving ella were headache (18% overall) and nausea (12% overall) and abdominal and upper abdominal pain (12% overall). Table 1 lists those adverse reactions that were reported in ≥ 5% of subjects in the clinical studies (14).

6.2 Postmarketing Experience

The following adverse reactions have been identified during post-approval use of ella:

Skin and Subcutaneous Tissue Disorders: Acne

Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

7 DRUG INTERACTIONS

Several in vivo drug interaction studies have shown that ella is predominantly metabolized by CYP3A4.

7.1 Changes in Emergency Contraceptive Effectiveness Associated with Co-Administration of Other Products

Drugs or herbal products that induce CYP3A4 decrease the plasma concentrations of ella, and may decrease its effectiveness [see Warnings and Precautions (5.4) and Pharmacokinetics (12.3)]. Avoid co-administration of ella and drugs or herbal products such as:

- barbiturates
- bosentan
- carbamazepine
- felbamate
- griseofulvin
- oxcarbazepine
- phenytoin
- rifampin
- St. John’s Wort
- topiramate

Reference ID: 3523922
7.2 Increase in Plasma Concentrations of ella Associated with Co-Administered Drugs

CYP3A4 inhibitors such as itraconazole or ketoconazole increase plasma concentrations of ella [see Pharmacokinetics (12.3)].

7.3 Effects of ella on Co-Administered Drugs

*In vitro* studies demonstrated that ella does not induce or inhibit the activity of cytochrome P450 enzymes.

P-glycoprotein (P-gp) transporters: *In vitro* data indicate that ulipristal may be an inhibitor of P-gp at clinically relevant concentrations. Thus, co-administration of ulipristal acetate and P-gp substrates (e.g., dabigatran etexilate, digoxin) may increase the concentration of P-gp substrates. *In vivo* data suggest that ulipristal acetate 10 mg does not affect P-gp transporters. However, there was no *in vivo* drug interaction study between ulipristal acetate 30 mg and P-gp transporters [see Pharmacokinetics (12.3)].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category X. [See Contraindications (4).]

Use of ella is contraindicated during an existing or suspected pregnancy. There are no adequate and well controlled studies in pregnant women.

Ulipristal acetate was administered repeatedly to pregnant rats and rabbits during the period of organogenesis. Embryofetal loss was noted in all pregnant rats and in half of the pregnant rabbits following 12 and 13 days of dosing, at daily drug exposures 1/3 and 1/2 the human exposure, respectively, based on body surface area (mg/m²). There were no malformations of the surviving fetuses in these studies. Adverse effects were not observed in the offspring of pregnant rats administered ulipristal acetate during the period of organogenesis through lactation at drug exposures 1/24 the human exposure based on AUC. Administration of ulipristal acetate to pregnant monkeys for 4 days during the first trimester caused pregnancy termination in 2/5 animals at daily drug exposures 3 times the human exposure based on body surface area.

8.3 Nursing Mothers

The breast milk of 12 lactating women following administration of ella was collected in 24-hour increments to measure the concentrations of ulipristal acetate and monodemethyl-ulipristal acetate in breast milk. The mean daily concentrations of ulipristal acetate in breast milk were 22.7 ng/mL [0-24 hours], 2.96 ng/mL [24-48 hours], 1.56 ng/mL [48-72 hours], 1.04 ng/mL [72-96 hours], and 0.69 ng/mL [96-120 hours]. The mean daily concentrations of monodemethyl-ulipristal acetate in breast milk were 4.49 ng/mL [0-24 hours], 0.62 ng/mL [24-48 hours], 0.28 ng/mL [48-72 hours], 0.17 ng/mL [72-96 hours], and 0.10 ng/mL [96-120 hours].

The effect of this exposure on newborns/infants has not been studied; therefore, risk to the breast-fed child cannot be excluded. Therefore, use of ella by breastfeeding women is not recommended.

8.4 Pediatric Use

Safety and efficacy of ella have been established in women of reproductive age. Safety and efficacy are expected to be the same for postpubertal adolescents less than 18 years and for users 18 years and older. Use of ella before menarche is not indicated.

8.5 Geriatric Use

This product is not intended for use in postmenopausal women.

8.6 Race

While no formal studies have evaluated the effect of race, a cross-study comparison of two pharmacokinetic studies indicated that exposure in South Asians may exceed that in Caucasians and African Americans. However, no difference in efficacy and safety was observed for women of different races in clinical studies.
8.7 Hepatic Impairment
No studies have been conducted to evaluate the effect of hepatic disease on the disposition of ella.

8.8 Renal Impairment
No studies have been conducted to evaluate the effect of renal disease on the disposition of ella.

10 OVERDOSAGE
Experience with ulipristal acetate overdose is limited. In a clinical study, single doses equivalent to up to 4 times ella were administered to a limited number of subjects without any adverse reactions.

11 DESCRIPTION
The ella (ulipristal acetate) tablet for oral use contains 30 mg of a single active steroid ingredient, ulipristal acetate [17α-acetoxy-11β-(4-N,N-dimethylaminophenyl)-19-norpregna-4,9-diene-3,20-dione], a synthetic progesterone agonist/antagonist. The inactive ingredients are lactose monohydrate, povidone K-30, croscarmellose sodium and magnesium stearate.

Ulipristal acetate is a white to yellow crystalline powder which has a molecular weight of 475.6. The structural formula is:

\[ C_{30}H_{37}NO_4 \]

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action
When taken immediately before ovulation is to occur, ella postpones follicular rupture. The likely primary mechanism of action of ulipristal acetate for emergency contraception is therefore inhibition or delay of ovulation; however, alterations to the endometrium that may affect implantation may also contribute to efficacy.

12.2 Pharmacodynamics
Ulipristal acetate is a selective progesterone receptor modulator with antagonistic and partial agonistic effects (a progesterone agonist/antagonist) at the progesterone receptor. It binds the human progesterone receptor and prevents progesterone from occupying its receptor.

The pharmacodynamics of ulipristal acetate depends on the timing of administration in the menstrual cycle. Administration in the mid-follicular phase causes inhibition of folliculogenesis and reduction of estradiol concentration. Administration at the time of the luteinizing hormone peak delays follicular rupture by 5 to 9 days. Dosing in the early luteal phase does not significantly delay endometrial maturation but decreases endometrial thickness by 0.6 ± 2.2 mm (mean ± SD).

12.3 Pharmacokinetics
Absorption
Following a single dose administration of ella in 20 women under fasting conditions, maximum plasma concentrations of ulipristal acetate and the active metabolite, monodemethyl-ulipristal acetate, were 176 and 69 ng/ml and were reached at 0.9 and 1 hour, respectively.
Table 2: Pharmacokinetic Parameter Values Following Administration of ella (ulipristal acetate) Tablet 30 mg to 20 Healthy Female Volunteers under Fasting Conditions

<table>
<thead>
<tr>
<th></th>
<th>Mean (± SD)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>$C_{\text{max}}$ (ng/ml)</td>
</tr>
<tr>
<td>Ulipristal acetate</td>
<td>176 (89)</td>
</tr>
<tr>
<td>Monodemethyl-ulipristal acetate</td>
<td>69 (26)</td>
</tr>
</tbody>
</table>

$C_{\text{max}}$ = maximum concentration
$\text{AUC}_{0-t}$ = area under the drug concentration curve from time 0 to time of last determinable concentration
$\text{AUC}_{0-\infty}$ = area under the drug concentration curve from time 0 to infinity
$t_{\text{max}}$ = time to maximum concentration
$t_{1/2}$ = elimination half-life
* Median (range)

Effect of food: Administration of ella together with a high-fat breakfast resulted in approximately 40 - 45% lower mean $C_{\text{max}}$, a delayed $t_{\text{max}}$ (from a median of 0.75 hours to 3 hours) and 20 - 25% higher mean $\text{AUC}_{0-\infty}$ of ulipristal acetate and monodemethyl-ulipristal acetate compared with administration in the fasting state. These differences are not expected to impair the efficacy or safety of ella to a clinically significant extent; therefore, ella can be taken with or without food.

Distribution
Ulipristal acetate is highly bound (> 94%) to plasma proteins, including high density lipoprotein, alpha-l-acid glycoprotein, and albumin.

Metabolism
Ulipristal acetate is metabolized to mono-demethylated and di-demethylated metabolites. *In vitro* data indicate that this is predominantly mediated by CYP3A4. The mono-demethylated metabolite is pharmacologically active.

Excretion
The terminal half-life of ulipristal acetate in plasma following a single 30 mg dose is estimated to 32.4 ± 6.3 hours.

Drug interactions
**CYP3A4 inducers:** When a single 30 mg dose of ulipristal acetate was administered following administration of the strong CYP3A4 inducer, rifampin 600 mg once daily for 9 days, $C_{\text{max}}$ and $\text{AUC}$ of ulipristal acetate decreased by 90% and 93% respectively. The $C_{\text{max}}$ and $\text{AUC}$ of monodemethyl-ulipristal acetate decreased by 84% and 90% respectively [see Drug Interactions (7.1)].
**CYP3A4 inhibitors:** When a single 10 mg dose of ulipristal acetate was administered following administration of the strong CYP3A4 inhibitor, ketoconazole 400 mg once daily for 7 days, \(C_{\text{max}}\) and \(\text{AUC}\) of ulipristal acetate increased by 2- and 5.9-fold, respectively. While the \(\text{AUC}\) of monodemethyl-ulipristal acetate increased by 2.4-fold, \(C_{\text{max}}\) of monodemethyl-ulipristal acetate decreased by 47%. There was no *in vivo* drug-drug interaction study between ulipristal acetate 30 mg and CYP3A4 inhibitors [see Drug Interactions (7.1)].

**P-glycoprotein (P-gp) transporters:** When a single 60 mg dose of fexofenadine, a substrate of P-gp glycoprotein, was administered 1.5 hours after the administration of a single 10 mg dose of ulipristal acetate, there was no increase in \(C_{\text{max}}\) or \(\text{AUC}\) of fexofenadine.

### 13 NONCLINICAL TOXICOLOGY

#### 13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

**Carcinogenicity:** Carcinogenicity studies with ulipristal acetate have not been conducted.

**Genotoxicity:** Ulipristal acetate was not genotoxic in the Ames assay, *in vitro* mammalian assays utilizing mouse lymphoma cells and human peripheral blood lymphocytes, and in an *in vivo* micronucleus assay in mice.

**Impairment of fertility:** Single oral doses of ulipristal acetate prevented ovulation in 50% of rats at 2 times the human exposure based on body surface area (mg/m²). Single doses of ulipristal acetate given on post-coital days 4 or 5 prevented pregnancy in 80-100% of rats and in 50% of rabbits when given on post-coital days 5 or 6 at drug exposures 4 and 12 times the human exposure based on body surface area. Lower doses administered for 4 days to rats and rabbits were also effective at preventing ovulation and pregnancy.

### 14 CLINICAL STUDIES

Two multicenter clinical studies evaluated the efficacy and safety of *ella*. An open-label study provided the primary data to support the efficacy and safety of ulipristal acetate for emergency contraception when taken 48 to 120 hours after unprotected intercourse. A single-blind comparative study provided the primary data to support the efficacy and safety of ulipristal acetate for emergency contraception when taken 0 to 72 hours after unprotected intercourse and provided supportive data for ulipristal acetate for emergency contraception when taken > 72 to 120 hours after unprotected intercourse. Women in both studies were required to have a negative pregnancy test prior to receiving emergency contraception. The primary efficacy analyses were performed on subjects less than 36 years of age who had a known pregnancy status after taking study medication.

</table>

* Time after unprotected intercourse when *ella* was taken

** Number of pregnancies per 100 women at risk for pregnancy

#### 14.1 Open-Label Study

This study was a multicenter open-label trial conducted at 40 family planning clinics in the United States. Healthy women with a mean age of 24 years who requested emergency contraception 48 to 120 hours after unprotected intercourse received a dose of 30 mg ulipristal acetate (*ella*). The median BMI for the study subjects was 25.3 and ranged from 16.1 to 61.3 kg/m².

Twenty-seven pregnancies occurred in 1,242 women aged 18 to 35 years evaluated for efficacy. The number of pregnancies expected without emergency contraception was calculated based on the timing of intercourse with regard to each woman’s menstrual cycle. *ella* statistically significantly reduced the pregnancy rate, from an expected rate of 5.5% to an observed rate of 2.2%, when taken 48 to 120 hours after unprotected intercourse.

#### 14.2 Single-Blind Comparative Study

This study was a multicenter, single-blind, randomized comparison of the efficacy and safety of 30 mg ulipristal acetate (*ella*) to levonorgestrel (another form of emergency contraception). Subjects were enrolled at 35 sites in the U.S., the United Kingdom and Ireland, with the majority (66%) having been enrolled in the U.S. Healthy women with a mean age of 25 years who requested emergency contraception within 120 hours of unprotected intercourse were enrolled and randomly
allocated to receive ella or levonorgestrel 1.5 mg. The median BMI for the study subjects was 25.3 and ranged from 14.9 to 70.0 kg/m².

In the ella group, 16 pregnancies occurred in 844 women aged 16 to 35 years when emergency contraception was taken 0 to 72 hours after unprotected intercourse. The number of pregnancies expected without emergency contraception was calculated based on the timing of intercourse with regard to each woman’s menstrual cycle; ella statistically significantly reduced the pregnancy rate, from an expected 5.6% to an observed 1.9%, when taken within 72 hours after unprotected intercourse. There were no pregnancies observed in the women who were administered ella more than 72 hours after unprotected intercourse (10% of women who received ella).

14.3 Pooled Analysis

Data from the two studies were pooled to provide a total efficacy population of women treated with ulipristal acetate up to 120 hours after UPI. Time Trend analysis for the five 24-hour intervals from 0 to 120 hours between unprotected intercourse and treatment was conducted. There were no significant differences in the observed pregnancy rates across the five time intervals.

Subgroup analysis of the pooled data by BMI showed that for women with BMI > 30 kg/m² (16% of all subjects), the observed pregnancy rate was 3.1% (95% CI: 1.7, 5.7), which was not significantly reduced compared to the expected pregnancy rate of 4.5% in the absence of emergency contraception taken within 120 hours after unprotected intercourse. In the comparative study, a similar effect was seen for the comparator emergency contraception drug, levonorgestrel 1.5 mg. For levonorgestrel, when used by women with BMI > 30 kg/m², the observed pregnancy rate was 7.4% (95% CI: 3.9, 13.4), compared to the expected pregnancy rate of 4.4% in the absence of emergency contraception taken within 72 hours after unprotected intercourse.

16 HOW SUPPLIED/STORAGE AND HANDLING

ella (ulipristal acetate) tablet, 30 mg is supplied in a PVC-PE-PVDC-aluminum blister. The tablet is a white to off-white, round, curved tablet marked with “ella” on both sides.

NDC 50102-911-01 (1 tablet unit of use package)

Store at 20-25°C (68-77°F). [See USP controlled room temperature.]

Keep the blister in the outer carton in order to protect from light. Keep out of reach of children.

17 PATIENT COUNSELING INFORMATION

[See FDA- Approved Patient Labeling]

Information for Patients

- Instruct patients to take ella as soon as possible and not more than 120 hours after unprotected intercourse or a known or suspected contraceptive failure.
- Advise patients that they should not take ella if they know or suspect they are pregnant and that ella is not indicated for termination of an existing pregnancy.
- Advise patients to contact their healthcare provider immediately in case of vomiting within 3 hours of taking the tablet, to discuss whether to take another tablet.
- Advise patients to seek medical attention if they experience severe lower abdominal pain 3 to 5 weeks after taking ella, in order to be evaluated for an ectopic pregnancy.
- Advise patients to contact their healthcare provider and consider the possibility of pregnancy if their period is delayed after taking ella by more than 1 week beyond the date it was expected.
- Advise patients not to use ella as routine contraception, or to use it repeatedly in the same menstrual cycle.
- Advise patients that ella may reduce the contraceptive action of regular hormonal contraceptive methods and to use a reliable barrier method of contraception after using ella, for any subsequent acts of intercourse that occur in that same menstrual cycle.
- Advise patients not to use ella if they are taking a CYP3A4 inducer.
- Inform patients that ella does not protect against HIV infection (AIDS) and other sexually transmitted diseases/infections.
- Advise patients that they should not use ella if they are breastfeeding because ella enters the breast milk.
FDA-Approved Patient Labeling
Patient Information
ella ("el-uh")
(ulipristal acetate) tablet

Read this Patient Information Leaflet before you take ella. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or treatment.

What is ella?
ella is a prescription emergency contraceptive that reduces your chance of becoming pregnant if your birth control fails or you have unprotected sex.
ella should not be used as your regular birth control. It is very important that you have a reliable form of birth control that is right for you.
ella will not protect you against HIV infection (AIDS) and other sexually transmitted diseases (STDs).

Who should not take ella?
- Do not take ella if you know or suspect you are already pregnant. ella is not for use to end an existing pregnancy. Talk to your healthcare provider before taking ella if you think you are pregnant.
- Do not take ella if you are breastfeeding because ella gets into the breast milk.

What should I tell my healthcare provider before taking ella?
See “Who should not take ella?”
Tell your healthcare provider about all the medicines you take, including prescription and nonprescription medicines, vitamins, and herbal supplements.
Using some other medicines may make ella less effective. These include St. John’s Wort, phenytoin, rifampin, phenobarbital and carbamazepine. Talk to your healthcare provider about whether ella is right for you if you are currently using these medications.
Talk to your healthcare provider if you use hormonal birth control. Using ella may make your regular hormonal birth control method less effective. After using ella, you should use a reliable barrier method of birth control (such as a condom with spermicide) during any other times that you have sex in that same menstrual cycle.
Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

When is it not appropriate to use ella?
- Do not use ella as a regular birth control method. It does not work as well as most other forms of birth control when they are used consistently and correctly.
- Do not use ella if you are already pregnant.
- Do not use ella more than one time in the same menstrual cycle for different acts of unprotected sex or birth control failure.

How does ella work?
ella is thought to work for emergency contraception primarily by stopping or delaying the release of an egg from the ovary. It is possible that ella may also work by preventing attachment (implantation) to the uterus.

How should I take ella?
- Take ella as soon as possible within 5 days (120 hours) after unprotected sex or if you had a birth control failure.
- ella can be taken with or without food.
- Contact your healthcare provider right away if you vomit within 3 hours of taking **ella**. Your healthcare provider may prescribe another dose of **ella** for you.
- **ella** can be taken at any time during the menstrual cycle.

**How effective is ella?**

If **ella** is taken as directed, it will reduce the chance that you will get pregnant. **ella** is not effective in every case. **ella** is only to be used for a single episode of unprotected intercourse. Be sure to use a regular birth control method the next time you have sex.

**ella** and other emergency contraceptives may be less effective in women with a body mass index (BMI) > 30 kg/m².

**What if I am already pregnant and use ella?**

**ella** should not be taken if you are already pregnant. There is little information on whether **ella** would harm a developing baby. Contact your healthcare provider if you think you may be pregnant and have taken **ella**.

**ella** is not for use to terminate an existing pregnancy.

**What should I do if my menstrual period is delayed beyond 1 week or I have severe lower stomach (abdominal) pain?**

After taking **ella**, your next menstrual period may begin a few days earlier or later than expected. If your period is more than 7 days later than expected, you may be pregnant. You should get a pregnancy test and follow up with your healthcare provider.

If you have severe lower stomach (abdominal) pain about 3 to 5 weeks after taking **ella**, you may have a pregnancy outside of the uterus (womb), which is called an ectopic or tubal pregnancy. An ectopic pregnancy is a serious condition that needs medical treatment right away. Call your healthcare provider or go to the nearest emergency room right away if you think you may have an ectopic pregnancy.

**How often can I use ella?**

**ella** is meant for emergency contraception only, and is not to be used frequently or as a regular birth control. If you need to use emergency contraception often, talk to your healthcare provider and learn about methods for birth control and sexually transmitted disease prevention that are right for you.

**What are the possible side effects of ella?**

The most common side effects of **ella** include:

- headache
- nausea
- stomach (abdominal) pain
- menstrual pain (dysmenorrhea)
- tiredness
- dizziness

Some women taking **ella** may have their next period earlier or later than expected. If your period is more than a week late, you should get a pregnancy test.

Tell your healthcare provider if you have any side effect that bothers you or that does not go away.

These are not all the possible side effects of **ella**. For more information, ask your healthcare provider or pharmacist.

Call your healthcare provider for medical advice about side effects. You may report side effects to FDA 1-800-FDA-1088.
How should I store ella?

- Store **ella** at 68-77°F (20-25°C).
- Protect **ella** from light. Keep **ella** in the blister card inside the original box until you are ready to take it.

Do not use **ella** if the package is torn or broken.

Keep **ella** and all medicines out of the reach of children.

**General information about the safe and effective use of ella:**

Medicines are sometimes prescribed for purposes other than those in a Patient Information Leaflet. Do not use **ella** for a condition for which it was not prescribed. Do not give **ella** to other people, even if they have the same symptoms that you have. It may harm them.

In the case of an overdose, get medical help or contact a Poison Control Center right away at 1-800-222-1222. Overdose experience with **ella** is limited.

This Patient Information Leaflet summarizes the most important information about **ella**. If you would like more information, talk with your healthcare provider. You can ask your pharmacist or healthcare provider for information about **ella** that is written for health professionals.

For more information, go to [www.ella-rx.com](http://www.ella-rx.com) or you can contact Afaxys, Inc. Medical Communications at 1-855-888-2467.

**What are the ingredients in ella?**

**Active ingredients:** ulipristal acetate, 30 mg

**Inactive ingredients:** lactose monohydrate, povidone, croscarmellose sodium, and magnesium stearate
