

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all of the information needed to use ZTLIDO™ (lidocaine topical system) 1.8% safely and effectively. See full prescribing information for ZTLIDO™.

ZTLIDO™ (lidocaine topical system)

Initial U.S. Approval: 1953

INDICATIONS AND USAGE

ZTLIDO contains lidocaine, an amide local anesthetic, and is indicated for relief of pain associated with post-herpetic neuralgia (PHN) (1).

DOSAGE AND ADMINISTRATION

- Because of the difference in bioavailability of ZTLIDO compared to Lidoderm, a different dosage strength is required to be administered to the patient. One ZTLIDO (lidocaine topical system) 1.8% provides equivalent lidocaine exposure to one Lidoderm (lidocaine patch 5%) (2.1).
- Apply ZTLIDO to intact skin to cover the most painful area. Apply the prescribed number of topical systems (up to three) only once for up to 12 hours in a 24-hour period. ZTLIDO may be cut into smaller sizes prior to removal of the release liner. Debilitated patients or those with impaired elimination should use smaller areas of treatment (2.2).

DOSAGE FORMS AND STRENGTHS

ZTLIDO 1.8% is available as a single-use topical system (3).

CONTRAINDICATIONS

ZTLIDO is contraindicated in patients with a known history of sensitivity to local anesthetics of the amide type, or to any other component of the product (4).

WARNINGS AND PRECAUTIONS

- Accidental Exposure:** Even a used ZTLIDO topical system contains residual lidocaine after use. It is important for patients to store and dispose of ZTLIDO properly and keep out of the reach of children, pets, and others (5.1).

- Excessive Dosing/Overexposure:** Applying ZTLIDO to larger surface areas or for a longer duration than recommended could lead to increased absorption and high blood concentrations of lidocaine, leading to adverse effects (5.2).
- Increased Absorption on Non-Intact Skin:** May result in higher blood concentrations of lidocaine (5.2).
- Risk of Overexposure with External Heat Sources:** Applying external heat sources to ZTLIDO may result in increased drug exposure (5.2).
- Application Site Reactions:** During or immediately after treatment with ZTLIDO, application site reactions may develop (5.3).
- Hypersensitivity Reactions:** Cross sensitivity to ZTLIDO in patients with a history of drug sensitivity to para-aminobenzoic acid (PABA) derivatives is possible (5.4).
- Eye Exposure:** Immediately wash out the eye with water or saline and protect the eye until sensation returns (5.5).

ADVERSE REACTIONS

Common adverse reactions are application site reactions such as irritation, erythema, and pruritus (6).

To report SUSPECTED ADVERSE REACTIONS, contact Scilex Pharmaceuticals Inc. at 1-800-SCILEX3 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG INTERACTIONS

- Class I Antiarrhythmic Drugs:** When ZTLIDO is used in patients receiving Class I antiarrhythmic drugs (such as tocainide and mexiletine) the toxic effects are additive and potentially synergistic. Consider risk/benefit before concomitant use (7.1).
- Local Anesthetic Agents:** When ZTLIDO is used concomitantly with other products containing local anesthetic agents, the effects are additive. Consider the amount of drug absorbed from all formulations when local anesthetics are administered concomitantly (7.2).

USE IN SPECIFIC POPULATIONS

Lactation: Lidocaine is excreted into human milk. Caution should be exercised when ZTLIDO is administered to a nursing mother, especially when administered with other local anesthetics (8.2).

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

ZTLIDO (lidocaine topical system) 1.8% is indicated for relief of pain associated with post-herpetic neuralgia (PHN).

2 DOSAGE AND ADMINISTRATION

2.1 Important Dosage and Administration Instructions

Because of the difference in bioavailability of ZTLIDO compared to Lidoderm® (lidocaine patch 5%), a different dosage strength is required to be administered to the patient. One ZTLIDO (lidocaine topical system) 1.8% provides equivalent lidocaine exposure to one Lidoderm® (lidocaine patch 5%) [see *Clinical Pharmacology (12.3)*].

When ZTLIDO is used concomitantly with other products containing local anesthetic agents, the total amount of drug absorbed from all formulations must be considered.

ZTLIDO may not stick if it gets wet. Advise patients to avoid contact with water, such as bathing, swimming, or showering.

Instruct patients to wash hands immediately after handling ZTLIDO and to avoid contact with eyes [see *Warnings and Precautions (5.5), Patient Counseling Information (17)*].

Instruct patients to store ZTLIDO inside the sealed envelope and to apply immediately after removal from the envelope. Advise them to store ZTLIDO out of the reach of children, pets, and others. Instruct patients to, after use, fold used ZTLIDO so that the adhesive side sticks to itself and safely discard used ZTLIDO or pieces of cut ZTLIDO where children and pets cannot get to them [see *Warnings and Precautions (5.1), Patient Counseling Information (17)*].

Advise patients not to apply external heat sources, such as heating pads or electric blankets, directly to ZTLIDO because plasma lidocaine levels are increased. ZTLIDO can be applied, however, to the administration site after moderate heat exposure, such as 15 minutes of heating pad exposure on a medium setting [see *Warnings and Precautions (5.2), Clinical Pharmacology (12.3), Patient Counseling Information (17)*].

ZTLIDO may be used during moderate exercise, such as biking for 30 minutes.

ZTLIDO topical systems that have lifted at the edges may be reattached by pressing firmly on the edges. If a ZTLIDO topical system comes off completely and will not stick to patient's skin, it should be thrown away and a new ZTLIDO topical system should be applied for a total duration of 12 hours of used and new topical system together.

2.2 Post-herpetic Neuralgia

Apply ZTLIDO to intact skin to cover the most painful area. Apply the prescribed number of topical systems (maximum of 3), only once for up to 12 hours within a 24-hour period (12 hours on and 12 hours off). ZTLIDO may be cut into smaller sizes with scissors prior to removal of the release liner. Clothing may be worn over the

area of application. Smaller areas of treatment are recommended in a debilitated patient, or a patient with impaired elimination.

If irritation or a burning sensation occurs during application, advise patients to remove ZTLIDO and do not reapply until the irritation subsides.

3 DOSAGE FORMS AND STRENGTHS

ZTLIDO 1.8% is available as a single-use topical system packaged in an individual envelope.

4 CONTRAINDICATIONS

ZTLIDO is contraindicated in patients with a known history of sensitivity to local anesthetics of the amide type, or to any other component of the product.

5 WARNINGS AND PRECAUTIONS

5.1 Accidental Exposure

Even a used ZTLIDO topical system contains residual lidocaine after use. The potential exists for a small child or a pet to suffer serious adverse effects from chewing or ingesting a new or used ZTLIDO. It is important for patients to store and dispose of ZTLIDO properly, and keep out of the reach of children, pets, and others [*see Dosage and Administration (2)*].

5.2 Excessive Dosing/Overexposure to Lidocaine

Lidocaine toxicity can be expected at lidocaine blood concentrations above 5 mcg/mL. The blood concentration of lidocaine is determined by the rate and extent of lidocaine absorption and elimination. Longer duration of application, application of more than the recommended number of ZTLIDO, smaller patients, or impaired elimination may all contribute to increasing the blood concentration of lidocaine.

If lidocaine overdose is suspected, check drug blood concentration. Management of overdose includes close monitoring, supportive care, and symptomatic treatment [*see Overdosage (10)*].

Improper Application and Duration of Use:

Application of more than the recommended number of ZTLIDO or applying ZTLIDO for longer than the recommended wearing time (12 hours of every 24 hours) could result in increased absorption and high blood concentrations of lidocaine, leading to adverse effects. Advise patients on proper application and duration [*see Patient Counseling Information (17)*].

Hepatic Disease:

Impaired elimination may contribute to increasing blood concentrations of lidocaine. Patients with severe hepatic disease are at greater risk of developing toxic blood concentrations of lidocaine because of their inability to metabolize lidocaine normally.

Use on Non-Intact Skin:

Application to broken or inflamed skin, although not tested, may result in higher blood concentrations of lidocaine from increased absorption. ZTLIDO is only recommended for use on intact skin. Advise patients not to apply ZTLIDO to non-intact skin [see *Patient Counseling Information (17)*].

External Heat Sources:

External heat sources may increase drug exposure, leading to overexposure to lidocaine. Advise patients not to apply external heat sources to ZTLIDO during administration [see *Clinical Pharmacology (12.3)*, *Patient Counseling Information (17)*].

5.3 Application Site Reactions

During or immediately after treatment with ZTLIDO, the skin at the site of application may develop blisters, bruising, burning sensation, depigmentation, dermatitis, discoloration, edema, erythema, exfoliation, irritation, papules, petechia, pruritus, vesicles, or may be the locus of abnormal sensation. These reactions are generally mild and transient, resolving spontaneously within a few minutes to hours. Inform patients of these potential reactions and that severe skin irritation may occur with ZTLIDO if applied for a longer period than instructed.

5.4 Hypersensitivity Reactions

Patients allergic to para-aminobenzoic acid (PABA) derivatives (procaine, tetracaine, benzocaine, etc.) have not shown cross-sensitivity to lidocaine. However, be aware of the potential for cross-sensitivity in patients allergic to PABA derivatives, especially if the etiologic agent is uncertain. Manage hypersensitivity reactions by conventional means. The detection of sensitivity by skin testing is of doubtful value.

5.5 Eye Exposure

The contact of ZTLIDO with eyes, although not studied, should be avoided based on findings of severe eye irritation with the application of similar products in animals. If eye contact occurs, immediately wash out the eye with water or saline and protect the eye (such as, eye glasses/eye wear) until sensation returns.

6 ADVERSE REACTIONS

The following serious adverse reactions are described elsewhere in the labeling:

- Application Site Reactions [see *Warnings and Precautions (5.3)*]
- Hypersensitivity Reactions [see *Warnings and Precautions (5.4)*]

The following adverse reactions from voluntary reports or clinical studies have been reported with lidocaine. Because some of these reactions were reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Skin and subcutaneous tissues: blisters, bruising, burning sensation, depigmentation, dermatitis, discoloration, edema, erosions, erythema, exfoliation, flushing, irritation, papules, petechia, pruritus, vesicles, and abnormal sensation.

Immune system: angioedema, bronchospasm, dermatitis, dyspnea, hypersensitivity, laryngospasm, pruritus, shock, and urticaria.

Central Nervous System: lightheadedness, nervousness, apprehension, euphoria, confusion, dizziness, drowsiness, tinnitus, blurred or double vision, sensations of heat, cold or numbness, twitching, tremors, convulsions, unconsciousness, somnolence, respiratory depression and arrest.

Cardiovascular: bradycardia, hypotension, and cardiovascular collapse leading to arrest.

Other: asthenia, disorientation, headache, hyperesthesia, hypoesthesia, metallic taste, nausea, pain exacerbated, paresthesia, taste alteration, and vomiting.

7 DRUG INTERACTIONS

7.1 Antiarrhythmic Drugs

When ZTLIDO is used in patients receiving Class I antiarrhythmic drugs (such as tocainide and mexiletine), the toxic effects are additive and potentially synergistic. Consider risk/benefit during concomitant use.

7.2 Local Anesthetics

When ZTLIDO is used concomitantly with other products containing local anesthetic agents, the effects are additive. Consider the amount of drug absorbed from all formulations when local anesthetic agents are administered concomitantly.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

The limited human data with lidocaine in pregnant woman are not sufficient to inform drug-associated risk for major birth defects and miscarriage.

The use of lidocaine for labor neuraxial analgesia has not been associated with an increased incidence of adverse fetal effects either during delivery or during the neonatal period [see *Data*]. Should ZTLIDO be used concomitantly with other products containing lidocaine, consider total drug doses contributed by all formulations.

In a published animal reproduction study, pregnant rats administered lidocaine by continuous subcutaneous infusion at a dose approximately 45 times the maximum recommended daily dose (MRDD) of 108 mg in ZTLIDO during the period of organogenesis resulted in lower fetal body weights. In a published animal reproduction study, pregnant rats administered lidocaine, containing 1:100,000 epinephrine, injected into the masseter muscle of the jaw or into the gum of the lower jaw at 0.5 times the MRDD on Gestation Day 11 resulted in developmental delays in neonates [see *Data*].

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies carry some risk of birth defects, loss, or other adverse outcomes. In the U.S. general

population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2% to 4% and 15% to 20%, respectively.

Data

Human Data

In 22 parturient women given 1.5% lidocaine epidural anesthesia, there were no effects on neonatal behavior, using the early neonatal neurobehavioral scale (ENNS). Neuraxial analgesia also did not affect fetal heart rate, beat-to-beat variability, or uterine activity.

Animal Data

Reproductive studies with lidocaine have been performed in rats at doses up to 30 mg/kg (2.7 times the maximum recommended daily dose [MRDD] of 108 mg from ZTLIDO on a mg/m² basis) subcutaneously and have revealed no evidence of harm to the fetus due to lidocaine.

In a published study, lidocaine administered to pregnant rats by continuous subcutaneous infusion during the period of organogenesis at 100, 250, and 500 mg/kg/day, did not produce any structural abnormalities, but did result in lower fetal weights at 500 mg/kg/day dose (approximately 45 times the MRDD on a mg/m² basis) in the absence of maternal toxicity.

In a published study, lidocaine containing 1:100,000 epinephrine at a dose of 6 mg/kg (approximately 0.5 times the MRDD on a mg/m² basis) injected into the masseter muscle of the jaw or into the gum of the lower jaw of pregnant Long-Evans hooded rats on Gestation Day 11 resulted in developmental delays in the neonates. Developmental delays were observed for negative geotaxis, static righting reflex, visual discrimination response, sensitivity and response to thermal and electrical shock stimuli, and water maze acquisition. The developmental delays of the neonatal animals were transient, with responses becoming comparable to untreated animals later in life. The clinical relevance of these animal data is uncertain.

8.2 Lactation

Risk Summary

Lidocaine is excreted into human milk. When lidocaine was used as an epidural anesthetic for cesarean section in 27 women, a milk:plasma ratio of 1.07 was observed using AUC values. Lactating women undergoing a dental procedure had an 0.4 milk:plasma ratio. In another dental procedure study, a single patient was administered 20 mg of lidocaine and the milk:plasma ratio was reported as 1.1 at five to six hours after injection. These data and the low concentrations of lidocaine in the plasma after topical administration of ZTLIDO in recommended doses, suggest that a small amount of lidocaine would be ingested orally by a suckling infant. However, caution should be exercised when ZTLIDO is administered to a nursing mother, especially when administered with other local anesthetics.

8.4 Pediatric Use

Safety and effectiveness in pediatric patients have not been established.

8.5 Geriatric Use

Clinical studies of ZTLIDO did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. In general, dose selection for an elderly patient should be done with caution, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

10 OVERDOSAGE

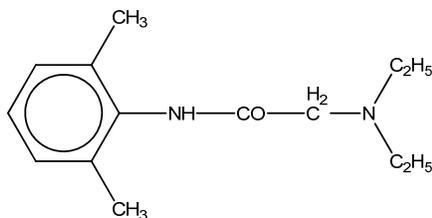

Lidocaine overdose from cutaneous absorption is rare, but could occur. If there is any suspicion of lidocaine overdose, check drug blood concentration. The management of overdose includes close monitoring, supportive care, and symptomatic treatment. Dialysis is of negligible value in the treatment of acute overdose with lidocaine.

In the absence of massive topical overdose or oral ingestion, evaluation of symptoms of toxicity should include consideration of other etiologies for the clinical effects, or overdosage from other sources of lidocaine or other local anesthetics.

11 DESCRIPTION

ZTLIDO (lidocaine topical system) 1.8% is a single-layer, drug-in-adhesive topical delivery system comprised of an adhesive material containing 36 mg lidocaine, which is applied to a pliable nonwoven cloth backing and covered with a polyethylene terephthalate film release liner. The release liner is removed prior to application to the skin. The size of ZTLIDO is 10 cm × 14 cm × 0.08 cm.

Lidocaine, an amide local anesthetic, is chemically designated as acetamide, 2-(diethylamino)-*N*-(2,6-dimethylphenyl), has an octanol: water partition ratio of 43 at pH 7.4, and has the following structure:

Each ZTLIDO contains 36 mg of lidocaine (18 mg per gram adhesive) in a non-aqueous base and also contains the following inactive ingredients: butylated hydroxytoluene, dipropylene glycol, isostearic acid, mineral oil, polyisobutylene, silicone dioxide, styrene/isoprene/styrene block copolymer, and terpene resin.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Lidocaine is an amide local anesthetic. Lidocaine blocks sodium ion channels required for the initiation and conduction of neuronal impulses.

12.2 Pharmacodynamics

The penetration of lidocaine into intact skin after application of ZTLIDO is sufficient to produce an analgesic effect, but less than the amount necessary to produce a complete sensory block.

12.3 Pharmacokinetics

ZTLIDO has different bioavailability compared to Lidoderm®. In a single-dose, crossover study conducted in 53 healthy volunteers, ZTLIDO (lidocaine topical system) 1.8% demonstrated equivalent exposure (AUC) and peak concentration (C_{max}) of lidocaine to Lidoderm® (lidocaine patch 5%).

Absorption

The amount of lidocaine systemically absorbed from ZTLIDO is directly related to both the duration of application and the surface area over which it is applied. In a pharmacokinetic study, three ZTLIDO topical systems were applied over an area of 420 cm² of intact skin on the backs of normal healthy volunteers for 12 hours. Blood samples were drawn for determination of lidocaine concentration during the topical system application and for 12 hours after removal of topical systems. The results are summarized in [Table 1](#).

Formatted: Font: 12 pt

Table 1
Mean ± SD Absorption of lidocaine from ZTLIDO
Normal volunteers (n = 54, 12-hour application time)

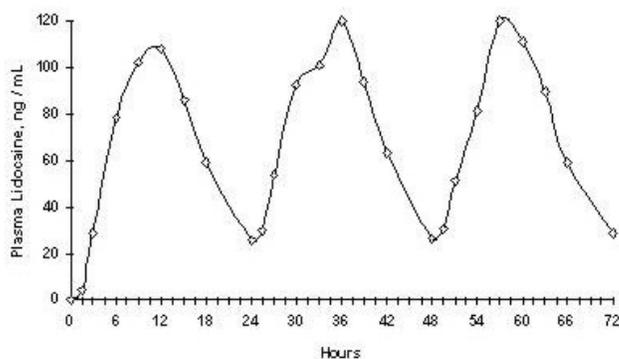

| Topical System | Application Site | Area (cm ²) | C _{max} (ng/mL) | T _{max} (hr)* |
|--------------------------------------|------------------|-------------------------|--------------------------|------------------------|
| 3 Topical systems of ZTLIDO (108 mg) | Back | 420 | 75.1 ± 28.0 | 13.9 (4.0, 18.0) |

*median (min, max)

Repeated application of three Lidoderm® patches simultaneously for 12 hours (recommended maximum daily dose), once per day for three days, indicated that the lidocaine concentration does not increase with daily use. The mean plasma pharmacokinetic profile for the 15 healthy volunteers is shown in [Figure 1](#).

Figure 1

Mean lidocaine blood concentrations after three consecutive daily applications of three Lidoderm patches simultaneously for 12 hours per day in healthy volunteers (n = 15).

The pharmacokinetics of ZTLIDO (n=3 topical systems) was assessed in 12 healthy volunteers with exposure to external heat source (heating pad at medium setting applied for 20 minutes at Time 0 and 8.5 hours) or undergoing moderate exercise (cycling for 30 minutes at a heart rate of 108 bpm at Time 0, 2.5, 5.5 and 8.5 hours) and compared to pharmacokinetics of ZTLIDO at rest. Exposure to external heat at 0 and 8.5 hours results in increased peak plasma levels of lidocaine with a mean (SD) of 160.3 ± 100.1 ng/mL versus the peak plasma levels observed at rest with a mean (SD) of 97.6 ± 36.9 ng/mL. For this reason, instruct patients not to apply heating pads directly to ZTLIDO. Concentrations returned to normal within 4 hours after the heat was removed. No clinically relevant differences in systemic absorption were observed under exercise conditions with a mean (SD) peak plasma concentrations of 90.5 ± 25.4 ng/mL.

A separate study in 12 healthy volunteers showed that there was no effect on ZTLIDO pharmacokinetics when the topical system is applied to the administration site after external heat exposure (heating pad at medium setting applied for 15 minutes prior to the topical system application) or after engagement in exercise (walking at a moderate pace on a treadmill for approximately 20 minutes beginning approximately 30 minutes prior to the topical system application).

Distribution

When lidocaine is administered intravenously to healthy volunteers, the volume of distribution is 0.7 to 2.7 L/kg (mean 1.5 ± 0.6 SD, n = 15). At concentrations produced by application of ZTLIDO, lidocaine is approximately 70% bound to plasma proteins, primarily alpha-1-acid glycoprotein. At much higher plasma concentrations (1 to 4 $\mu\text{g/mL}$ of free base), the plasma protein binding of lidocaine is concentration dependent. Lidocaine crosses the placental and blood brain barriers, presumably by passive diffusion.

Elimination

Metabolism:

It is not known if lidocaine is metabolized in the skin. Lidocaine is metabolized rapidly by the liver to a number of metabolites, including monoethylglycinexylidide (MEGX) and glycinexylidide (GX), both of which have pharmacologic activity similar to, but less potent than that of lidocaine. A minor metabolite, 2,6-xylidine, has unknown pharmacologic activity. The blood concentration of this metabolite is negligible following application of ZTLIDO. Following intravenous administration, MEGX and GX concentrations in serum range from 11 to 36% and from 5 to 11% of lidocaine concentrations, respectively.

Excretion:

Lidocaine and its metabolites are excreted by the kidneys. Less than 10% of lidocaine is excreted unchanged. The half-life of lidocaine elimination from the plasma following IV administration is 81 to 149 minutes (mean 107 ± 22 SD, $n = 15$). The systemic clearance is 0.33 to 0.90 L/minute (mean 0.64 ± 0.18 SD, $n = 15$).

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Long-term studies in animals specifically designed to evaluate the carcinogenic potential of lidocaine or ZTLIDO have not been conducted.

A metabolite, 2,6-xylidine, has been found to be carcinogenic in rats. The clinical significance is not known.

Mutagenesis

Lidocaine HCl was not mutagenic in the in vitro bacterial reverse mutagenicity assay (Ames test). Lidocaine HCl was not clastogenic in the in vitro chromosome aberration assay with human lymphocytes or in the in vivo mouse micronucleus test.

Impairment of Fertility

In a published study, female Sprague-Dawley rats were treated subcutaneously with lidocaine via osmotic pumps starting two weeks prior to mating, and reproductive effects were assessed. Rats dosed up to the high dose of 500 mg/kg/day (approximately 45 times the MRDD on a mg/m² basis) showed no effects on copulatory rate, pregnancy rate, or the numbers of corpora lutea or implantations.

14 CLINICAL STUDIES

Single-dose treatment with lidocaine patch (currently preferred dosage form term for a patch is topical system) was compared to treatment with vehicle patch (without lidocaine), and to no treatment (observation only) in a double-blind, crossover clinical trial with 35 post-herpetic neuralgia patients. Pain intensity and pain relief scores were evaluated periodically for 12 hours. Lidocaine patch performed statistically better than vehicle patch in terms of pain intensity from 4 to 12 hours.

Multiple-dose, two-week treatment with lidocaine patch was compared to vehicle patch (without lidocaine) in a double-blind, crossover clinical trial of withdrawal-type design conducted in 32 patients, who were considered as responders to the open-label use of lidocaine patch prior to the study. The constant type of pain was evaluated but not the pain induced by sensory stimuli (dysesthesia). Statistically significant differences favoring lidocaine patch were observed in terms of time to exit from the trial (14 versus 3.8 days at p-value <0.001), daily average pain relief, and patient's preference of treatment. About half of the patients also took oral medication commonly used in the treatment of post-herpetic neuralgia. The extent of use of concomitant medication was similar in the two treatment groups.

Based on a clinical study in 54 subjects with ZTLIDO, 47 subjects (87%) had adhesion scores of 0 ($\geq 90\%$ adhered) for all evaluations performed every 3 hours during the 12 hours of administration, 7 subjects (13%) had adhesion scores of 1 ($\geq 75\%$ to < 90% adhered) for at least one evaluation, and no subjects had scores of 2 or greater (< 75% adhered).

16 HOW SUPPLIED/STORAGE AND HANDLING

ZTLIDO (lidocaine topical system) 1.8% is available as the following:

Carton of 30 topical systems, packaged into individual child-resistant envelopes.

NDC 69557-111-30

Store at 25°C (77°F); excursions permitted to 15°-30°C (59°-86°F). [See USP Controlled Room Temperature].

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved Patient Labeling and Instructions for Use.

Accidental Exposure and Disposal

Advise patients to store ZTLIDO out of the reach of children, pets, and others. Advise patients to dispose of used ZTLIDO by folding used ZTLIDO so that the adhesive side sticks to itself and safely discarding used ZTLIDO or pieces of cut ZTLIDO where children, pets, and others cannot come in contact with them.

Proper Application

Advise patients:

- to avoid getting ZTLIDO wet (e.g., bathing, showering, swimming) [*see Dosage and Administration (2.1)*].
- not to apply more than the prescribed number (up to 3 ZTLIDO) [*see Dosage and Administration (2.2), Warnings and Precautions (5.2)*].
- not to wear ZTLIDO longer than the recommended wearing time (12 hours of every 24 hours) [*see Dosage and Administration, Warnings and Precautions (5.2)*].
- not to apply ZTLIDO to non-intact skin [*see Warnings and Precautions (5.2)*].

- to reattach by pressing firmly on the edges, ZTLIDO that are lifting at the edges. If a ZTLIDO topical system comes off completely and will not stick to patient's skin, it should be thrown away and a new ZTLIDO topical system should be applied for a total duration of 12 hours of used and new topical system together [see *Dosage and Administration (2.1)*].

Eye Exposure

Advise patients to wash hands immediately after handling ZTLIDO and to avoid contact with eyes. Instruct patients to, if eye contact should occur, immediately wash out the eye with water or saline and protect the eye until sensation returns [see *Dosage and Administration (2.1)*, *Warnings and Precautions (5.5)*].

February 2018

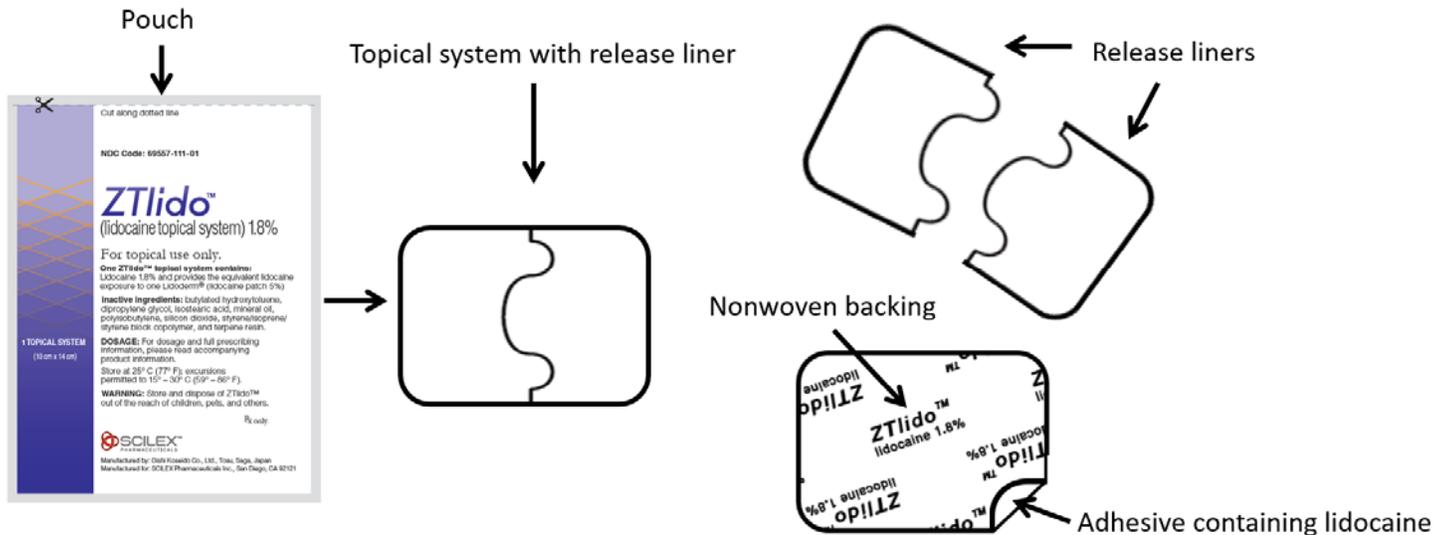

Instructions for Use
ZTLIDO™ (ZEE-TEE-LIE-DOH)
(lidocaine topical system)

Read this Instructions for Use before you start using the ZTLIDO and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical treatment or condition.

Important information:

- One ZTLIDO (lidocaine topical system) 1.8% provides equivalent lidocaine exposure to one Lidoderm® (lidocaine patch 5%).
- ZTLIDO is for use on intact skin only.
- ZTLIDO comes in a child-resistant envelope. Do not open the ZTLIDO envelope until you are ready to use it.
- Apply the prescribed number of ZTLIDO topical systems at one time.
- You should only use a maximum of 3 ZTLIDO topical systems at a time.
- Keep your prescribed number of ZTLIDO topical systems on for up to 12 hours within a 24-hour period (12 hours on and 12 hours off).
- Avoid contact with water, such as bathing, swimming or showering while using ZTLIDO. ZTLIDO may not stick if it gets wet.
- ZTLIDO topical systems that have lifted at edges may be re-attached by pressing firmly on the edges. If a your ZTLIDO comes off completely and will not stick to your skin, it should be thrown away (see **Step 6**). If your ZTLIDO topical system comes off completely, you may put on a new ZTLIDO topical system for a total duration of 12 hours for used and new topical systems together.

Figure A: ZTLIDO Topical System

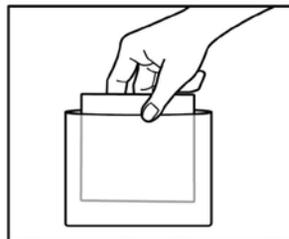

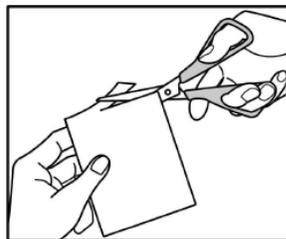

Applying your ZTLIDO topical system:

| | |
|---|--|
| <p>Step 1: Select the application site.</p> <ul style="list-style-type: none"> • ZTLIDO should only be applied to clean, dry, and intact skin to cover the most painful area. | |
|---|--|

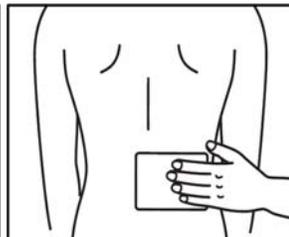

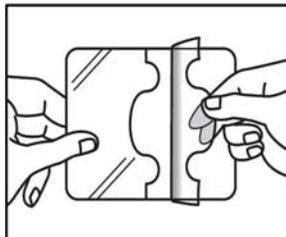

Step 2: Using scissors, carefully cut the envelope along the dotted line and open it to remove ZTLIDO.

- Do not use ZTLIDO if it is damaged. Throw it away and get a new one.
- ZTLIDO may be cut into smaller sizes with scissors prior to removal of the transparent release liner.

Step 3a: Remove the transparent release liner before applying ZTLIDO to the skin. Apply ZTLIDO right away after removing the transparent release liner. Apply ZTLIDO only to intact skin.

Step 3b: Place the adhesive side of ZTLIDO to skin, while not touching the sticky side. Smooth the ZTLIDO using your hands and firmly press to make sure it sticks well to skin.

Step 4: Wash your hands right away after applying ZTLIDO.

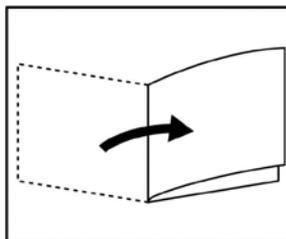

- Avoid contact of your hands or fingers with your eyes until hands are washed.

Removing your ZTLIDO topical system:

Step 5: Remove ZTLIDO from your skin after you have worn it for up to 12 hours.

- Fold the used ZTLIDO so that the sticky sides stick together.

Step 6: Throw away the used whole or cut pieces of ZTLIDO where children and pets cannot get to them.

- Wash your hands right away after removing ZTLIDO.

Application of a replacement ZTLIDO (a new ZTLIDO):

- If the ZTLIDO you are wearing comes off completely and will not stick to your skin, throw away the used ZTLIDO as instructed above in Step 6.
- Apply a replacement ZTLIDO the same way you would apply a new ZTLIDO as described above in Steps 1 through 6.
- Take off the replacement ZTLIDO at your usual removal time.
- The **total time** you may wear the used and replacement ZTLIDO **should not be more than 12 hours**.

PATIENT INFORMATION
ZTLIDO™ (ZEE-TEE-LIE-DOH)
(lidocaine topical system)

What is ZTLIDO?

ZTLIDO is a prescription medicine used for relief of pain from damaged nerves (neuropathic pain) that follows healing of shingles. It is not known if ZTLIDO is safe and effective in children.

Do not use ZTLIDO if you:

- have a history of allergic reactions to numbing medicines (anesthetics). Ask your healthcare provider if you are not sure.
- are allergic to any of the ingredients in ZTLIDO. See the end of this leaflet for a complete list of ingredients in ZTLIDO.

Before using ZTLIDO, tell your healthcare provider about all your medical conditions, including if you:

- have liver problems.
- are allergic to para-aminobenzoic acid (PABA) medicines such as procaine, tetracaine, or benzocaine.
- are pregnant or plan to become pregnant. It is not known if ZTLIDO will harm your unborn baby.
- are breastfeeding or plan to breastfeed. ZTLIDO can pass into your breast milk. Talk to your healthcare provider about the best way to feed your baby if you use ZTLIDO.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. **Especially, tell your healthcare provider if you are using other lidocaine containing products or anesthetic medicines.**

How should I use ZTLIDO?

Read the Instructions for Use at the end of this Patient Information leaflet for information about how to apply the ZTLIDO topical system.

- Use ZTLIDO exactly as your healthcare provider tells you to use it.
- Do not apply more than your prescribed number of ZTLIDO. You may apply up to 3 ZTLIDO topical systems at one time.
- A ZTLIDO may be worn only 1 time for up to 12 hours within a 24-hour period (12 hours on and 12 hours off).
- Apply ZTLIDO to intact skin only. Do not apply ZTLIDO to skin that is not intact, such as skin that is cut, scraped, burned, or irritated.
- ZTLIDO topical systems that are lifting at the edges maybe reattached by firmly pressing down on the edges.
- If the ZTLIDO you are wearing comes off completely, and will not stick to your skin, throw away the used ZTLIDO. You may apply a replacement (a new) ZTLIDO. Take off the replacement ZTLIDO at your usual removal time. The **total time** you may wear the used and replacement ZTLIDO **should not be more than 12 hours**.
- You may wear clothing over the ZTLIDO application site.
- Do not apply external heat sources, such as heating pads or electric blankets, directly on ZTLIDO. This may cause increased levels of lidocaine in your blood. You may apply ZTLIDO to a treatment site after moderate heat exposure, such as after 15 minutes of heating pad use on a medium setting.
- ZTLIDO may be used during moderate exercise, such as biking for 30 minutes.
- After using ZTLIDO, fold the used ZTLIDO so that the sticky sides stick together. Safely throw away used ZTLIDO and any pieces of cut ZTLIDO where children and pets cannot get to them.
- Wash your hands right away after applying or handling ZTLIDO.
- If you start feeling irritation or burning when applying ZTLIDO, remove the ZTLIDO. Do not reapply ZTLIDO until the irritation or burning goes away.
- If you apply more than 3 ZTLIDO topical systems or apply ZTLIDO for longer than 12 hours of a 24-hour period, call your healthcare provider.

What should I avoid while using ZTLIDO?

- Avoid contact with water, such as bathing, swimming, or showering while wearing ZTLIDO. ZTLIDO may not stick if it gets wet. Avoid contact of your hands and fingers with your eyes while handling ZTLIDO.

What are the possible side effects of ZTLIDO?

ZTLIDO may cause serious side effects, including:

- **Lidocaine overdose** can happen if you apply more than the prescribed number of ZTLIDO, applying ZTLIDO for longer than 12 hours, have liver problems, use ZTLIDO on skin that is not intact, or if you apply external heat sources directly on ZTLIDO. This can result in increased levels of lidocaine in your blood.
 - Do not apply more than the prescribed number of ZTLIDO.
 - Do not wear ZTLIDO longer than 12 hours.
 - Do not apply ZTLIDO on skin that is not intact, such as skin that is cut, scraped, burned, or irritated.
 - Do not apply external heat sources directly to ZTLIDO. See **“How should I use ZTLIDO?”** for more information about how to properly use external heat sources when using ZTLIDO.

- **Application site reactions.** Skin reactions at the ZTLIDO application site are common and are usually mild, but can be severe if ZTLIDO is applied for a longer period of time than prescribed. These reactions can happen during or right after treatment with ZTLIDO. Application site reactions will usually go away within a few minutes to hours. Symptoms of application site reactions may include:
 - blisters
 - bruising
 - burning or abnormal sensation
 - change or loss of color of your skin
 - swelling, redness, and pain of the skin
 - peeling or flaking of skin
 - irritation
 - pimple-like raised skin
 - itching
- **Allergic reactions** can happen if you have a history of allergic reactions to numbing medicines (anesthetics). Tell your healthcare provider right away if you have any symptoms of an allergic reaction such as swelling or shortness of breath.
- **Contact of ZTLIDO with your eyes** can happen if you touch your eyes while handling the topical system and can cause severe eye irritation. Avoid eye contact with your hands and fingers while handling ZTLIDO. Wash your hands right away after handling ZTLIDO. If the medicine in ZTLIDO comes in contact with your eye, wash out your eye with water or saline right away. Protect the eye (for example eye glasses or eye wear) until the numbness goes away.

These are not all the possible side effects of ZTLIDO.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store ZTLIDO?

- Store ZTLIDO at room temperature between 68°F to 77°F (20°C to 25°C).
- Keep ZTLIDO topical system in the original packaging unit until ready for use.

Keep ZTLIDO and all medicines out of the reach of children, pets, and others.

General information about the safe and effective use of ZTLIDO.

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use ZTLIDO for a condition for which it was not prescribed. Do not give ZTLIDO to other people, even if they have the same symptoms you have. It may harm them. You can ask your pharmacist or healthcare provider for information about ZTLIDO that is written for health professionals.

What are the ingredients in ZTLIDO?

Active ingredient: lidocaine

Inactive ingredients: butylated hydroxytoluene, dipropylene glycol, isostearic acid, mineral oil, polyisobutylene, silicone dioxide, styrene/isoprene/styrene block copolymer, and terpene resin.
