CLINICAL PHARMACOLOGY AND
BIOPHARMACEUTICS REVIEW(S)
CLINICAL PHARMACOLOGY AND BIOPHARMACEUTICS REVIEW

NDA 19-537
Date of Submission August 4, 2003
Brand name Cipro®
Generic name Ciprofloxacin HCl
Applicant Bayer
Type of submission Pediatric Supplemental NDA
Primary Reviewer Dakshina M. Chilukuri, Ph.D.
Pharmacometrics Reviewer Jenny J. Zheng, Ph. D.
Team Leader Philip Colangelo, Pharm.D, Ph.D.
Date of Review March 24, 2004

Executive Summary
Bayer was issued a Written Request (WR) in October 2001 to satisfy the pediatric exclusivity requirements. As part of the WR, an efficacy and safety study was conducted in pediatric patients from 1 to 17 years of age with complicated urinary tract infections (cUTI) and/or acute pyelonephritis. In addition, a pharmacokinetic substudy of ciprofloxacin in these pediatric patients with cUTI and/or acute pyelonephritis was also conducted. The proposed indication is treatment of cUTI and/or acute pyelonephritis.

A population PK (POPPK) analysis was conducted using data from a total of 6 pediatric studies. These 6 studies included the efficacy study conducted to satisfy the WR requirement along with 5 other studies performed in pediatric patients with varied disease diagnoses. These studies included a variety of infections such as urinary tract infection, lower respiratory tract infection, skin and soft tissue infection, severe sepsis, acute invasive diarrhea and cystic fibrosis. The POPPK analysis was conducted with the following objectives:

- To estimate typical population pharmacokinetic parameters for ciprofloxacin in pediatric patients.
- To identify covariate, demographic and clinical factors that are significant predictors of variability in ciprofloxacin pharmacokinetic parameters.
- To provide a dosing recommendation for pediatric patients.

Plasma ciprofloxacin concentration-time data were available in 357 pediatric patients. The age of these patients ranged from 0.27 to 16.9 years. The body weight of these patients ranged from 4.2 to 73.5 kg. One hundred and five patients were male and 252 patients were female. Twenty-eight out of 357 patients had a history of cystic fibrosis and 207 out of 357 patients were being treated for complicated urinary tract infection / acute pyelonephritis. Population pharmacokinetic analyses were performed with the NONMEM software using the First-Order Conditional Estimation (FOCE) method.

The pharmacokinetics of oral ciprofloxacin was described by a two-compartment model with first order absorption and absorption lag time. The POPPK analysis identified cystic fibrosis, body weight and creatinine clearance as the significant covariates for the
apparent clearance (CL/F) of ciprofloxacin. In addition, the effect of cystic fibrosis on the absorption rate constant (kₐ) was also found to be a significant covariate.

The predicted exposure of ciprofloxacin derived from the population PK analysis compared to the exposure observed in adults is given in Table 1.

**Table 1. Predicted ciprofloxacin exposure derived from the population PK analysis compared to the exposure observed in adults**

<table>
<thead>
<tr>
<th>Creatinine Clearance (mL/min)</th>
<th>Pediatric dose</th>
<th>Predicted AUC (µg-h/mL)</th>
<th>Adult dose</th>
<th>Observed AUC (µg-h/mL)</th>
</tr>

<tr>
<td>&gt;50</td>
<td>9 mg/kg BID (iv)</td>
<td>12.1</td>
<td>400 mg BID (iv)</td>
<td>12.7</td>
</tr>
</tbody>
</table>

The population based estimates for ciprofloxacin half-life (T½) ranged from approximately 4 to 5 hours in pediatric patients and was similar to that reported in adults (approximately 4 hours).

Based on the results of the efficacy study, the dosing regimen proposed for the treatment of cUTI and/or acute pyelonephritis is: (a) oral ciprofloxacin at doses of 10 to 20-mg/kg every 12 hours (maximum of 1500-mg per day) or (b) intravenous ciprofloxacin at doses of 6 to 10-mg/kg every 8 hours (maximum of 1200-mg per day) or intravenous ciprofloxacin at doses of 6 to 10-mg/kg every 8 hours (maximum of 1200-mg per day) followed by oral ciprofloxacin at doses of 10 to 20-mg/kg every 12 hours (maximum of 1500-mg per day).

**Reviewer’s Comments (Not to be sent to the sponsor):**

1. The POPPK analysis identified three significant covariates, namely, body weight, creatinine clearance and presence of cystic fibrosis in patients. The effect of cystic fibrosis on the absorption rate constant was also found to be a significant factor.

2. The applicant used body weight as a covariate with an allometric exponent of 0.75 for clearance parameters based on literature. Instead of this, the applicant should have estimated the allometric exponent, which would have ensured correct estimation of the effect of body weight on clearance.

3. The applicant used a base model comprising of body weight as a covariate. Several covariates such as age were tested using this base model. This approach is not optimal, since age and body weight are inter-related and so using a base model with body weight fails to distinguish the effect of age on clearance. Instead, the applicant should have tested the effect of age on the base model without body weight.

**Phase IV Commitments**

No Phase IV studies are requested.
**Recommendations:**
The Office of Clinical Pharmacology and Biopharmaceutics/Division of Pharmaceutical Evaluation III has reviewed the information included in the sNDA for ciprofloxacin in pediatric patients and has found it to be acceptable. The following dosing recommendation for ciprofloxacin in pediatric patients for use in complicated UTI infections and/or acute pyelonephritis, as used in the pivotal Phase III trial of Complicated Urinary Tract Infection (Study 100169), is proposed:

(a) oral ciprofloxacin at doses of 10 to 20-mg/kg every 12 hours (maximum of 1500-mg per day) or (b) intravenous ciprofloxacin at doses of 6 to 10-mg/kg every 8 hours (maximum of 1200-mg per day) or intravenous ciprofloxacin at doses of 6 to 10-mg/kg every 8 hours (maximum of 1200-mg per day) followed by oral ciprofloxacin at doses of 10 to 20-mg/kg every 12 hours (maximum of 1500-mg per day).
