FINDING OF NO SIGNIFICANT IMPACT

NDA 22-217

Aliskiren/Valsartan Film-Coated Tablets

The National Environmental Policy Act of 1969 (NEPA) requires Federal agencies to assess the environmental impact of their actions. FDA is required under NEPA to consider the environmental impact of approving certain drug product applications as an integral part of its regulatory process.

NDA 22-217 requests approval of Aliskiren/Valsartan film-coated tablets for the treatment of hypertension. Approval of this submission is expected to benefit patients unlikely to achieve control of blood pressure with a single agent. In support of its application, Novartis Pharmaceuticals Corporation prepared an environmental assessment (attached) in accordance with 21 CFR Part 25 which evaluates the potential environmental impact from use and disposal of this product.

The Food and Drug Administration, Center for Drug Evaluation and Research, has carefully considered the potential environmental impact due to approval of this application and has concluded that this action is not expected to have a significant effect on the human environment. Therefore, an environmental impact statement will not be prepared.

2 Name of applicant/petitioner
Novartis Pharmaceuticals Corporation

3 Address
One Health Plaza
East Hanover, NJ 07936-1080
4 Description of proposed action

4.1 Requested approval
Novartis has filed NDA 22-217 pursuant to section 505b of the FD&C Act for aliskiren / valsartan fixed dose combination film-coated tablets. An Environmental Assessment (EA) is submitted pursuant to 21 CFR part 25.

4.2 Need for action
Aliskiren and valsartan are currently approved separately in various dosage forms and strengths for the treatment of hypertension. This supplement provides for fixed combinations of aliskiren and valsartan in the form of 150/160 mg and 300/320 mg film-coated tablets, also for the treatment of hypertension. Approval of this submission is expected to benefit patients with hypertension whose blood pressure is not adequately controlled on monotherapy.

4.3 Locations of use
Patients with hypertension will use aliskiren / valsartan film-coated tablets in their homes, in clinics and in hospitals.

4.4 Disposal sites
Hospitals, pharmacies and clinics will dispose of empty or partially empty packages of drug product according to their internal established procedures. In the home, empty or partially empty containers will typically be disposed of by the community’s solid waste management system, which may include landfills, incineration and recycling. Minimal quantities of the unused drug may potentially be disposed of directly into the sewer system.

5 Identification of substances that are the subject of the proposed action

Aliskiren

5.1 Nomenclature

5.1.1 Established name (U.S. Adopted name – USAN)
Aliskiren hemifumarate

5.1.2 Brand/proprietary name/trade name
Rasilez®/Tekturna®
5.1.3 Chemical names

5.1.3.1 Chemical Abstracts Index name
Benzeneoctanamide, δ-amino-N-(3-amino-2,2-dimethyl-3-oxopropyl)-γ-hydroxy-4-methoxy-3-(3-methoxypropoxy)-α,ζ-bis(1-methylethyl)-, (αS,γS,δS,ζS)-(E)-2-butenedioate (2:1) (salt)

5.1.3.2 Systematic chemical name (IUPAC)
(2S,4S,5S,7S)-5-Amino-4-hydroxy-2-isopropyl-7-[4-methoxy-3-(3-methoxy-propoxy)-benzyl]-8-methyl-nonanoic acid (2-carbamoyl-2-methyl-propyl)-amide; ½ (E)-but-2-enedioic acid

5.1.4 Other names
SPP100, CGP60536B

5.2 Chemical Abstracts Service (CAS) registration number
173334-58-2 (hemifumarate)
173334-57-1 (free base)

5.3 Molecular formula

5.10 Structural formula
6 Environmental issues

6.1 Physical and chemical characterization

**Aliskiren hemifumarate**

Environmental fate and effects study reports for Rasilez®/Tekturna® drug substance have been initially reported to the agency in aliskiren film-coated tablets Original NDA 21-985 (submitted 13-Feb-2006). This information has been previously submitted to and reviewed by the Agency, and is not included in the present assessment. The information is summarized in Data Summary Table (Table 1) located at the end of this report.

Aliskiren hemifumarate shows low acute ecotoxicity to microorganism, algae, daphnia and fish. Based on its log P [log K_{ow}] value, aliskiren hemifumarate is not expected to significantly bioconcentrate in living organisms or to sorb onto organic particles. Further, due to the very high water solubility and the resulting low sorption prediction (Table 3, Table 4) no further sorption/desorption properties (logK_{oc}) were considered. Henry’s Law Constant was not determined, as aliskiren hemifumarate is not expected to be released into air or have a significant vapor pressure, based on its molecular weight and melting point of > 95°C. The aliskiren hemifumarate information is summarized in Data Summary Table (Table 1) at the end of this report.

**Valsartan**

All environmental fate and effects study reports for valsartan drug substance have been previously submitted to and reviewed by the Agency and have not been included in this Assessment: NDA 20-665 (submitted 28-Dec-1995; approved by FDA on 23-Dec-1996), NDA 20-818 (submitted 18-Mar-1997, approved 6-Mar-98) and NDA 21-283 (submitted 03-Aug-2000, approved 14-Aug-2002). The Data is summarized in a Summary Table (Table 2) located at the end of this report.

Valsartan shows very low acute ecotoxicity to microorganisms, algae, daphnia and fish. Based on its low log P [log K_{ow}] value, valsartan is not expected to significantly bioconcentrate in living organisms or to sorb onto organic particles. Since the log K_{ow} was less than 3 at all pH levels tested, no further sorption/desorption properties (log K_{oc}) were considered. Based upon the Henry’s Law Constant, valsartan would not be expected to be released into the air or have a significant vapor pressure. The valsartan information is summarized in Data Summary Table (Table 2) located at the end of this report.
6.2 Environmental depletion mechanisms

Aliskiren hemifumarate

Aliskiren hemifumarate has been determined to be hydrolytically stable to 83% within forced decomposition testing conducted over a 3-day period in an aqueous medium at 100°C. Based on these results, a half-life of several months up to a year at 25°C was estimated. Aliskiren has not been found to be biodegradable to a significant extent. Based on the UV/VIS absorption spectra [Drug substance elucidation of structure and other characteristics, Module 3], no significant absorption was found above 290 nm for aliskiren. Hence photodegradation is not regarded as a significant source of depletion for this substance. Results are reported in the Data Summary Table (Table 1).

Valsartan

Valsartan is hydrolytically stable at pH 5, 7 and 9 and was found not to be biodegradable aerobically or anaerobically to any significant extent. Since the molecule does not absorb light above 290 nm, photoinstability is not regarded as a relevant environmental depletion mechanism. Results are reported in the Data Summary Table (Table 2).

6.3 Environmental concentration

6.3.1 Expected Introduction Concentration (EIC)

As described in the July 1998 Guidance for Industry: Environmental Assessment of Human Drugs and Biologics Applications¹, the Expected Introduction Concentration (EIC) of an active moiety into the aquatic environment may be calculated as follows:

\[ \text{EIC-Aquatic (ppb)} = A \times B \times C \times D \]

where:

- \( A = \text{kg / yr produced for direct use (as active moiety)} \)
- \( B = \frac{1}{1.214 \times 10^{11}} \text{liters per day entering POTWs} \) [1996 Needs Survey, Report to Congress]
- \( C = \frac{1 \text{ year}}{365 \text{ days per year}} \)
- \( D = 10^9 \text{ µg/kg (conversion factor)} \)

The EIC of aliskiren hemifumarate and valsartan has been calculated for the peak production year estimates of the drug substance requirements for all Novartis products containing aliskiren and valsartan, including the new aliskiren / valsartan formulations, and for all approved indications. An estimate of drug substance production requirements for the peak year (2010 and 2013, for valsartan and aliskiren, respectively) is presented in [Confidential}
6.4 Summary

6.4.1 Aliskiren - aquatic environment

Studies were conducted to accurately determine the water solubility and partition coefficient of aliskiren hemifumarate. The results of the water solubility study indicate that aliskiren hemifumarate would be highly soluble in water over the environmental pH range. The n-octanol/water partition coefficient, which indicates the tendency of a non-ionized organic chemical to accumulate in fatty tissue and to sorb onto soil particles or other organic matter, suggests that aliskiren hemifumarate would not be expected to sorb significantly to the organic material in soil or sediment, and would not be expected to bioconcentrate substantially in aquatic organisms. The calculated results presented in Table 3 and Table 4 for the bioconcentration factor (BCF) and the soil adsorption coefficient (K_{oc}) support the conclusion that aliskiren hemifumarate would be expected to remain mobile in the aquatic compartment, and would not be expected to bioconcentrate or bioaccumulate.

Investigations of environmental depletion mechanisms demonstrated that aliskiren hemifumarate does not biodegrade or hydrolyze rapidly in the aquatic environment.

Five-year production estimates for Rasilez indicate that during the peak year, the EIC of aliskiren hemifumarate at the point of entry into the aquatic environment will be greater than 1 ppb. Novartis is confident that the actual EIC will not exceed these estimates by an order of magnitude.

Based upon these factors, the evaluation of the environmental effects of aliskiren hemifumarate was limited to the aquatic environment.

6.4.2 Valsartan - aquatic environment

Valsartan is pharmacologically active and is rapidly absorbed following oral administration. Since valsartan exists as a di-anion with a double negative charge at physiological pH, the compound is very hydrophilic, and may therefore be a poor substrate for metabolizing enzymes.

A study using radiolabeled valsartan solution showed that valsartan is metabolized to a small extent only. The only notable metabolite detectable in the plasma is the valeryl-4-hydroxy valsartan (M1), an oxidized form of valsartan. Since this metabolite has not demonstrated any pharmacological activity in vitro, the biotransformation of valsartan to M1 can be described as an additional minor elimination process.

Valsartan is predominantly excreted as unchanged drug through feces, most likely via biliary elimination. Excretion is 99% complete within 7 days. Renal excretion, which accounts for 5
to 13% of the oral dose, is essentially complete within 48 hours. The bulk of the dose (83%) is excreted with the feces within 4 days. About 81% of the dose is excreted as unchanged valsartan, 9% as the valeryl-4-hydroxy metabolite (M1) and about 6% as other unidentified compounds in the feces and urine.

Studies were conducted to determine the water solubility and partition coefficient of valsartan at pH 5.0, 7.0 and 9.0 at 25 °C (Data Summary Table 2). The results of the water solubility study indicate that valsartan would be relatively soluble in water over the environmental pH range. The n-octanol/water partition coefficient, which indicates the tendency of a non-ionized organic chemical to accumulate in fatty tissue and to sorb onto soil particles or other organic matter, suggests that valsartan would not be expected to sorb significantly to the organic material in soil or sediment, and would not be expected to bioconcentrate substantially in aquatic organisms. (Chemicals with a log P less than 1 are not expected to significantly bioconcentrate or sorb, whereas chemicals with a log P greater than or equal to 4 may be expected to bioconcentrate or sorb significantly.) The calculated results for the bioconcentration factor (BCF) and the soil adsorption coefficient (K_{oc}) presented in Table 5 and Table 6 further support the conclusion that valsartan would be expected to remain mobile in the aquatic compartment, and would not be expected to bioconcentrate or bioaccumulate.

Results of the ultraviolet/visible spectra scan indicated absorbance below 290 nm in aqueous buffer solutions over the environmental pH range. Direct photodegradation would not be considered a potential mechanism of depletion.

Investigations of environmental depletion mechanisms demonstrated that valsartan would be hydrolytically stable over the environmental pH range at 50°C, and would not be expected to biodegrade under either aerobic or anaerobic conditions during waste water treatment.

Five-year production estimates for Diovan drug products indicate that during the peak year, the EIC of valsartan at the point of entry into the aquatic environment will be significantly greater than 1 ppb. Novartis is confident that the actual EIC will not exceed these estimates by an order of magnitude.

Based upon these factors, the evaluation of the environmental effects of the pharmacologically active parent compound, valsartan, was limited to the aquatic environment.

### 6.5 Environmental effects of released substances

**Aliskiren hemifumarate**

The environmental effects of aliskiren hemifumarate were evaluated in the aquatic environment following the “Tiered Approach to Fate and Effects Testing” (Figure 1, July 1998 EA Guidance for Industry¹). Microbial inhibition was evaluated in accordance with OECD Guideline Number 209. Additionally, acute toxicity testing was conducted in green algae, *Daphnia magna* and zebra fish under Good Laboratory Practice (GLP) protocols utilizing OECD guidelines. Aliskiren did not show any inhibitory activity in microorganisms which may be found in activated sludge. Acute toxicity in the aquatic species tested was low with daphnia being the most sensitive species with an EC_{50} of 56 mg/L. Results are reported in the Data Summary Table (Table 1).
Valsartan

The environmental effects of valsartan was evaluated in the aquatic environment following the “Tiered Approach to Fate and Effects Testing” (Figure 1, July 1998 EA Guidance for Industry). With no rapid, complete environmental depletion mechanism identified, microbial inhibition was evaluated in accordance with Technical Assistance Document (TAD), Section 4.02. Additionally, acute toxicity testing was conducted in algae, daphnia and fish, utilizing standard methods according to either TAD 4.08, EU standard methodology or OECD guidelines. All studies were conducted under FDA Good Laboratory Practices (GLPs). Results indicate valsartan is non-inhibitory to microorganisms which may be found in activated sludge and does not show deleterious effects on algae, daphnia and fish up to high concentrations. Algae proved to be the most sensitive species, with an EC₅₀ of 90 mg/L. Results are reported in the Data Summary Table (Table 2).

6.5.1 Aliskiren and Valsartan assessment factors

As described in the July 1998 Guidance for Industry: Environmental Assessment of Human Drugs and Biologics Applications, an assessment factor is a toxicity ratio which provides a consistent regulatory basis for determining if and when additional ecotoxicity testing should be performed, using a tiered approach. The assessment factor may be calculated by dividing an appropriate acute toxicity test endpoint by the MEEC (Maximum Expected Environmental Concentration). An assessment factor greater than 1000 would not require additional ecotoxicity testing.

6.5.1.1 Aliskiren - assessment factor

In the case of aliskiren, by applying the 48-hour EC₅₀ from the *Daphnia magna* immobilization study and the EIC from [Confidential Appendix 11.2.2], an assessment factor of 23,333 is obtained. (Calculation of the assessment factor is provided in [Confidential Appendix 11.2.3]). Thus, no additional ecotoxicity testing would be required for aliskiren. Since the assessment factor calculated for aliskiren is a magnitude greater than that reported in the Guidance Document, the results suggest aliskiren is unlikely to be toxic in the aquatic environment.

6.5.1.2 Valsartan - assessment factor

In the case of valsartan, by applying the 72-hour EC₅₀ from the green algae study and the EIC from [Confidential Appendix 11.2.2], an assessment factor of 10,588 is obtained. (Calculation of the assessment factor is provided in [Confidential Appendix 11.2.3]). Thus, no additional ecotoxicity testing would be required for valsartan. Since the assessment factor calculated for valsartan is more than ten times higher than that reported in the Guidance Document, the results suggest valsartan is unlikely to be toxic in the aquatic environment.

7 Mitigation measures

Based upon the information and data presented in this environmental assessment, Novartis has concluded that no potential adverse environmental impacts are anticipated with the packaging,
distribution, use or disposal of aliskiren/valsartan film-coated tablets within the United States. No mitigation measures are considered necessary.

8 Alternatives to the proposed action

No alternatives to the proposed action are suggested, as no potential adverse environmental impacts have been identified for the packaging, distribution, use or disposal of aliskiren/valsartan film-coated tablets. The use of aliskiren/valsartan film-coated tablets will directly benefit patients with hypertension.

It is our conclusion that approval of this application is therefore preferable to non-approval.

9 List of preparers

Curriculum vitae, documenting the qualifications and credentials of the contributors to this environmental assessment, are provided in [Non-confidential Appendix 11.1.1].

OPS/ONDQA/DPA1
Through: Jon Clark, M.S.
OPS/IO/PARS
Subject: Review of Environmental Assessment
NDA 022-217
Aliskiren/Valsartan 150/160 mg and 300/320 mg film-coated tablets.
Sponsor: Novartis Pharmaceutical Corporation

A. Background

Novartis is requesting approval for Aliskiren/Valsartan 150/160 mg and 300/320 mg film-coated tablets for the treatment of hypertension. An Environmental Assessment (EA) has been submitted pursuant to 21 CFR part 25.

B. Discussion

The following review was conducted by [redacted] under contract to CDER/OPS on February 22, 2009, and approved by Raanan A. Bloom, Ph.D., OPS/IO/PARS, Senior Environmental Officer.

Executive Summary

NDA 22-217 requests approval of aliskiren/valsartan film-coated tablets for treatment of hypertension. All environmental fate and effects study reports for the drug substances were previously submitted and reviewed by the agency: NDAs 20-665, 20-818, and 21-283 for valsartan, and NDAs 21-985 and 22-107 for aliskiren. For convenience, the firm provided summaries of the results in this submission.
Novartis provided updated peak production requirements covering all Novartis products on the US market for the year 2013 in Confidential Appendix 11.2.1. The peak production year requirements for aliskiren hemifumarate for all Novartis products containing aliskiren hemifumarate for all indications are expected to be NMT \( \text{(b)(4)} \) kg. Assuming no metabolism or degradation, this peak production estimate corresponds to EIC = \( \text{(b)(4)} \) ppb in the aquatic environment (Confidential Appendix 11.2.2). The peak production year requirements for valsartan for all Novartis products containing valsartan for all indications are expected to be NMT \( \text{(b)(4)} \) kg. Assuming no metabolism or degradation, this peak production estimate corresponds to EIC = \( \text{(b)(4)} \) ppb in the aquatic environment (Confidential Appendix 11.2.2).

In the case of aliskiren hemifumarate, by using the 48-hour EC\(_{50}\) from the *Daphnia magna* study and the calculated EIC, an assessment factor of 23,333 is obtained (Confidential Appendix 11.2.3). Since the assessment factor calculated for aliskiren hemifumarate is greater than the tier 1 assessment factor of 1000, the results suggest aliskiren hemifumarate would be nontoxic in the aquatic environment.

Aliskiren hemifumarate may enter the aquatic environment from patient use and disposal. The toxicity of aliskiren hemifumarate to environmental organisms was previously characterized and reviewed. The results indicate that the compound is not expected to be toxic to organisms at the expected environmental introduction concentration.

In the case of valsartan, by using the 72-hour EC\(_{50}\) from the green algae study and the calculated EIC, an assessment factor of 10,588 is obtained (Confidential Appendix 11.2.3). Since the assessment factor calculated for valsartan is greater than the tier 1 assessment factor of 1000, the results suggest valsartan would be nontoxic in the aquatic environment.

Valsartan may enter the aquatic environment from patient use and disposal. The toxicity of valsartan to environmental organisms was previously characterized and reviewed. The results indicate that the compound is not expected to be toxic to organisms at the expected environmental introduction concentration.

A FONSI is recommended.
Review of September 12, 2008, Environmental Assessment

BACKGROUND:

I. DATE:

12-SEP-2008

Reference is also made to related aliskiren and valsartan NDAs:

Diovan® (Valsartan) Capsules, NDA 20-665
- Original submission: 20-NOV-1995
- Amendment 30-MAY-1996
- Amendment 22-OCT-1996

Diovan HCT® (Valsartan/ Hydrochlorothiazide) Tablets, NDA 20-818
- Original approval 06-MAR-1998
- Supplement (S-012) 12-SEP-2001

Diovan® (Valsartan) Tablets, NDA 21-283
- Original submission 03-AUG-2000
- Supplement (S-001) 05-JUL-2001
- Supplement (S-011) 31-OCT-2003

Rasilez®/Tekturna® (Aliskiren) Tablets, NDA 21-985
- 24-JAN-2006

Tekturna HCT® (Aliskiren/ Hydrochlorothiazide) Tablets, NDA 22-107
- Original Submission 20-MAR-2007
- Supplement (S-002) 12-NOV-2008

All environmental fate and effects study reports for aliskiren and valsartan drug substance were previously reported in the above referenced NDAs. The studies were previously reviewed by the Agency and FONSIs were issued. No new environmental fate and effects data are included in this Environmental Assessment.

II. APPLICANT: Novartis Pharmaceutical Corporation

III. ADDRESS: One Health Plaza
- East Hanover, New Jersey 07936-1080

IV. PROPOSED ACTION:

a. Requested Approval: Novartis is requesting approval for Aliskiren/Valsartan 150/160 mg and 300/320 mg film-coated tablets. This EA has been submitted pursuant to 21 CFR part 25.

b. Need for Action: Aliskiren and valsartan are currently approved separately, as well as in combinations in various dosage forms and strengths for the treatment of hypertension. This
application provides for fixed combinations of aliskiren and valsartan 150/160 mg and 300/320 mg film coated tablets. Approval of this submission is expected to benefit patients unlikely to achieve control of blood pressure with a single agent.

c. Locations of Use: Hospital, clinics and patients homes throughout the United States.
d. Disposal Sites: Empty or partially empty containers from U.S. hospitals, pharmacies or clinics will be disposed of according to hospital, pharmacy or clinic procedures. Empty or partially empty containers from home use typically will be disposed by a community’s solid waste management system which may include landfills, incineration and recycling, while minimal quantities of the unused drug may be disposed in the sewer system.

ADEQUATE

V. IDENTIFICATION OF CHEMICALS

Chemical identification for aliskiren and valsartan are provided on pages 3-6 of the EA. This information was the subject of previous reviews.

ADEQUATE

VI. ENVIRONMENTAL ISSUES

Aliskiren

Physical and chemical properties, and environmental fate and effects data were determined for aliskiren hemifumarate and were previously submitted in the EA for Tekturna® NDA 21-985 (submitted February 10, 2006, a FONSI issued April 27, 2006). Updated data on sorption and desorption studies were submitted in the EA for Tekturna HCT® NDA 22-107 (submitted Nov-12-2008, FONSI issued February 21, 2009). No new data is provided in this submission. For convenience, the previously submitted data is summarized below.

Physical and Chemical Characterization
With a pKₐ of 9.18 at 22°C, aliskiren hemifumarate is fully dissociated at environmentally relevant pH values. Aliskiren hemifumarate has a very high solubility in water and a low log Kow value. Aliskiren hemifumarate has low to moderate sorption (<45.6%) and moderate to high desorption (>28.3%). Based on these results aliskiren hemifumarate is not likely to significantly bioconcentrate in living organisms or to sorb to organic particles. Aliskiren hemifumarate is not expected to be released into the air or have a significant vapor pressure, based on the molecular weight and the melting point (>95°C).

Depletion mechanisms
Aliskiren hemifumarate is not metabolized significantly. Aliskiren hemifumarate is subject to very slow hydrolysis, with a half-life of several months up to a year at 25°C. Aliskiren is not biodegradable to a significant extent under environmental conditions. Significant photodegradation of aliskiren hemifumarate is not expected, since the UV absorption spectra showed no significant absorption peaks at environmental pH above 290 nm. No environmentally relevant rapid depletion mechanism is identified.
**Expected Introduction Concentration**

Novartis provided updated peak production requirements covering all Novartis products on the US market for the year 2013 in Confidential Appendix 11.2.1. The peak production year requirements for aliskiren hemifumarate for all Novartis products containing aliskiren hemifumarate for all indications are expected to be NMT \( \text{kg} \). This peak production estimate corresponds to \( \text{EIC} = \text{ppb} \) in the aquatic environment (Confidential Appendix 11.2.2).

**Environmental Effects:**

For convenience, the previously reviewed environmental effects data is summarized in this submission.

### Summary of Environmental Effects

<table>
<thead>
<tr>
<th>Test</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microbial Inhibition (activated sludge)</td>
<td>( IC_{50} = 4470 \text{mg/L} ) (3 hours)</td>
</tr>
<tr>
<td>Toxicity to algae (\textit{Scenedesmus spp.})</td>
<td>( EC_{50} &gt; 100 \text{mg/L} ) (72 hours) ( NOEC = 100 \text{mg/L} ) (72 hours)</td>
</tr>
<tr>
<td>Toxicity to \textit{Daphnia magna}</td>
<td>( EC_{50} = 56 \text{mg/L} ) (48 hours)   ( NOEC = 30 \text{mg/L} ) (48 hours)</td>
</tr>
<tr>
<td>Toxicity to Zebra fish (\textit{D. rerio})</td>
<td>( LC_{50} &gt; 100 \text{mg/L} ) (96 hours)  ( NOEC = 100 \text{mg/L} ) (96 hours)</td>
</tr>
</tbody>
</table>

**Assessment Factor**

The assessment factor was determined for the most sensitive species \textit{Daphnia magna}. The calculation is provided in Confidential Appendix 11.2.3. The assessment factor is equal to the \( EC_{50} (\textit{Daphnia magna})/\text{EIC} \) (aquatic), which is \( 56 \text{mg/L} / 0.0024 \text{ppm} = 23,333 \). Since 23,333 is significantly greater than the tier 1 assessment factor of 1000, no further testing is required (It is noted that based on the data provided, the firm qualifies for use of the tier 2 assessment factor of 100). The results indicate that aliskiren hemifumarate is not expected to be toxic to aquatic organisms at the expected environmental introduction concentration.

**Valsartan**

Physical and chemical properties, and environmental fate and effects data were determined for valsartan and were previously submitted in the EA for Diovan Capsules NDA 20-665 (submitted November 20, 1995, a FONSI issued December 3, 1996). No new data is provided in this submission. For convenience, the previously submitted data is summarized below.

**Physical and Chemical Characterization**

Valsartan is relatively soluble in water over the environmental pH range. Based on its low log \( K_{ow} \) value, valsartan is not expected to significantly bioconcentrate in living organisms or to sorb to organic particles. Since the log \( K_{ow} \) was less than 3 at all pH levels tested, no further
sorption/desorption properties (log $K_{OC}$) were considered. Valsartan is not expected to be released into the air or have a significant vapor pressure.

Depletion mechanisms
Valsartan is not metabolized significantly. Valsartan is hydrolytically stable, and does not biodegrade aerobically or anaerobically to any significant extent. Significant photodegradation of valsartan is not expected, since the UV absorption spectra showed no significant absorption peaks at environmental pH above 290 nm. No environmentally relevant rapid depletion mechanism is identified.

Expected Introduction Concentration
Novartis provided updated peak production requirements covering all Novartis products on the US market for the year 2013 in Confidential Appendix 11.2.1. The peak production year requirements for valsartan for all Novartis products containing valsartan for all indications are expected to be NMT $^{(b)(4)}$ kg. This peak production estimate corresponds to EIC $^{(b)(4)}$ ppb in the aquatic environment (Confidential Appendix 11.2.2).

Environmental Effects
For convenience, the previously reviewed environmental effects data is summarized in this submission.

<table>
<thead>
<tr>
<th>Test</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>

<td>$EC_{50} = 580$ ppm (48 hours)</td>
</tr>
<tr>
<td></td>
<td>$NOEC = 280$ mg/L</td>
</tr>
<tr>
<td>Acute toxicity in $Salmo gairdneri$ (= $Onocorhynchus mykiss$, rainbow trout)</td>
<td>$LC_{50} &gt; 100$ mg/L (96 hours)</td>
</tr>
<tr>
<td></td>
<td>$NOEC = 100$ ppm</td>
</tr>
</tbody>
</table>

Assessment factor
The assessment factor was determined for the most sensitive species, green algae, with an $EC_{50}$ of 90 mg/L. The calculation is provided in Confidential Appendix 11.2.3. The assessment factor is equal to the $EC_{50}$ (green algae)/EIC (aquatic) = 90 mg/L / 0.0085 ppm = 10,588. Since 10,588 is significantly greater than the tier 1 assessment factor of 1000, no further testing is required (It is noted that based on the data provided, the firm qualifies for use of the tier 2 assessment factor of 100). The results indicate that valsartan is not expected to be toxic to aquatic organisms at the expected environmental introduction concentration.

Conclusion
No significant environmental impact is expected from use or disposal of Aliskiren/Valsartan film-coated tablets. A FONSI is recommended.

ADEQUATE

VII. MITIGATION MEASURES

Information not required because no potential adverse environmental effects were identified.

ADEQUATE

VIII. ALTERNATIVES

Information not required because no potential adverse environmental effects were identified.

Non-confidential appendices
  11.1.1 Curriculum vitae of contributor
Confidential appendices
  11.2.1 Production estimates of aliskiren and valsartan drug substance requirements
  11.2.2 Expected Introduction Concentration (EIC) of aliskiren and valsartan based upon production estimates
  11.2.3 Calculation of assessment factor for aliskiren and valsartan

ADEQUATE

C. Comments and Conclusions
Based on an evaluation of the information provided in this EA and previous EAs, in FDA guidance, and on the scientific validity of the “no effects” conclusions of the EA, no significant adverse environmental impacts are expected from the introduction of aliskiren and valsartan residues into the environment due approval of this NDA for the treatment of hypertension.

A Finding of No Significant Impact (FONSI) is recommended.
