INDICATIONS AND USAGE
OMONTYS® is an erythropoiesis-stimulating agent (ESA) indicated for the treatment of anemia due to chronic kidney disease (CKD) in adult patients on dialysis (1.1). 

Limitations of Use
OMONTYS is not indicated and is not recommended for use:
- In patients with CKD not on dialysis (1.2).
- In patients receiving treatment for cancer and whose anemia is not due to CKD (1.2).
- As a substitute for RBC transfusions in patients who require immediate correction of anemia (1.2).
- OMONTYS has not been shown to improve symptoms, physical functioning or health-related quality of life (1.2).

DOSE AND ADMINISTRATION
- Initial treatment: 0.04 mg/kg body weight administered once monthly (2.3).
- Conversion from another ESA: dose once monthly based on the total weekly epoetin or darbepoetin alfa dose at the time of conversion (2.4).

ADVERSE REACTIONS
The most common adverse events (≥10%) are dyspnea, diarrhea, nausea, cough, and arteriovenous fistula site complication (6).

CONTRAINDICATIONS
- Uncontrolled hypertension (4).

WARNINGS AND PRECAUTIONS
- Increased Mortality, Myocardial Infarction, Stroke, and Thromboembolism: Using ESAs to target a hemoglobin level of greater than 11 g/dL increases the risk of serious adverse cardiovascular reactions and has not been shown to provide additional benefits (5.1). Use caution in patients with coexistent cardiovascular disease and stroke (5.1).
- Hypertension: Control hypertension prior to initiating and during treatment with OMONTYS (5.3).

PATIENT COUNSELING INFORMATION
See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

Reference ID: 3107278
FULL PRESCRIBING INFORMATION

WARNING: ESAs INCREASE THE RISK OF DEATH, MYOCARDIAL INFARCTION, STROKE, VENOUS THROMBOEMBOLISM, THROMBOSIS OF VASCULAR ACCESS AND TUMOR PROGRESSION OR RECURRENCE.

Chronic Kidney Disease:
- In controlled trials, patients experienced greater risks for death, serious adverse cardiovascular reactions, and stroke when administered erythropoiesis-stimulating agents (ESAs) to target a hemoglobin level of greater than 11 g/dL.
- No trial has identified a hemoglobin target level, ESA dose, or dosing strategy that does not increase these risks [see Warnings and Precautions (5.1)].
- Use the lowest OMONTYS dose sufficient to reduce the need for red blood cell (RBC) transfusions [see Warnings and Precautions (5.1)].

1 INDICATIONS AND USAGE
1.1 Anemia Due to Chronic Kidney Disease
OMONTYS® is indicated for the treatment of anemia due to chronic kidney disease (CKD) in adult patients on dialysis.

1.2 Limitations of Use
OMONTYS is not indicated and is not recommended for use:
- In patients with CKD not on dialysis because of safety concerns in this population [see Warnings and Precautions (5.1)].
- In patients receiving treatment for cancer and whose anemia is not due to CKD, because ESAs have shown harm in some settings and the benefit-risk factors for OMONTYS in this setting have not been evaluated [see Warnings and Precautions (5.2)].
- As a substitute for RBC transfusions in patients who require immediate correction of anemia.
- OMONTYS has not been shown to improve symptoms, physical functioning or health-related quality of life.

2 DOSAGE AND ADMINISTRATION
2.1 Evaluation of Iron Stores and Nutritional Factors
Evaluate the iron status in all patients before and during treatment and maintain iron repletion. Correct or exclude other causes of anemia (e.g., vitamin deficiency, metabolic or chronic inflammatory conditions, bleeding, etc.) before initiating OMONTYS [see Warnings and Precautions (5.6)].

2.2 Patients with Chronic Kidney Disease
Individualize dosing and use the lowest dose of OMONTYS sufficient to reduce the need for RBC transfusions [see Warnings and Precautions (5.1)]. In controlled trials, patients experienced greater risks for death, serious adverse cardiovascular reactions, and stroke when administered erythropoiesis-stimulating agents (ESAs) to target a hemoglobin level of greater than 11 g/dL. No trial has identified a hemoglobin target level, ESA dose, or dosing strategy that does not increase these risks. Physicians and patients should weigh the possible benefits of decreasing transfusions against the increased risks of death and other serious cardiovascular adverse events [see Boxed Warning and Clinical Studies (14)].
2.3 Initiation of Treatment and Starting Dose

Initiate OMONTYS treatment when the hemoglobin level is less than 10 g/dL.

The recommended starting dose for the treatment of anemia in patients who are not currently treated with an ESA is 0.04 mg/kg body weight administered as a single intravenous or subcutaneous injection once monthly.

2.4 Conversion from Epoetin Alfa or Darbepoetin Alfa to OMONTYS in Patients with CKD on Dialysis

OMONTYS is administered once monthly, either subcutaneously or intravenously.

In patients previously receiving epoetin alfa or darbepoetin alfa, estimate the starting monthly dose of OMONTYS for patients on the basis of the weekly dose of epoetin alfa or darbepoetin alfa at the time of substitution (see Table 1). Maintain the route of administration (intravenous or subcutaneous injection).

- For patients previously receiving epoetin alfa, the first dose of OMONTYS should be administered one week after the last epoetin alfa dose was administered.
- For patients previously receiving darbepoetin alfa, the first dose of OMONTYS should be administered at the next scheduled dose in place of darbepoetin alfa.

2.5 General Guidance including Dose Adjustments

Monitor hemoglobin levels at least every 2 weeks until stable, then monitor at least monthly. When adjusting therapy, consider hemoglobin rate of rise, rate of decline, ESA responsiveness and hemoglobin variability. A single hemoglobin excursion may not require a dosing change.

- Do not increase the dose more frequently than once every 4 weeks.
- If the hemoglobin rises rapidly (e.g., more than 1 g/dL in the 2 weeks prior to the dose or more than 2 g/dL in 4 weeks), reduce the dose of OMONTYS by 25% or more as needed to reduce rapid responses.
- If the hemoglobin level approaches or exceeds 11 g/dL, reduce or interrupt the dose of OMONTYS. After a dose has been withheld and once the hemoglobin begins to decrease, OMONTYS may be restarted at a dose approximately 25% below the previously administered dose.
- For patients who do not respond adequately, if the hemoglobin has not increased by more than 1 g/dL after 4 weeks of therapy, increase the dose by 25%.

Reference ID: 3107278
• For patients who do not respond adequately over a 12-week escalation period, increasing the OMONTYS dose further is unlikely to improve response and may increase risks. Use the lowest dose that will maintain a hemoglobin level sufficient to reduce the need for RBC transfusions. Evaluate other causes of anemia. Discontinue OMONTYS if responsiveness does not improve [see Warnings and Precautions (5.4)].

• If a dose of OMONTYS is missed, administer the missed dose as soon as possible and restart OMONTYS at the prescribed once monthly dosing frequency.

When treating dialysis patients who have chronic kidney disease and cancer, physicians should refer to Warnings and Precautions (5.1 and 5.2).

Refer patients who self-administer OMONTYS to the Instructions for Use [see Patient Counseling Information (17)].

2.6 Preparation and Administration of OMONTYS

OMONTYS is packaged as single use vials, single use pre-filled syringes, and multiple use vials. OMONTYS packaged in single use vials and single use pre-filled syringes contains no preservatives. OMONTYS is administered either subcutaneously or intravenously.

• Use the single use vial or single use pre-filled syringe only one time. Discard unused portion of OMONTYS in single use vials.

• Store unused portions of OMONTYS in multiple use vials at 36 °F to 46 °F (2 °C to 8 °C). Discard 28 days after first use.

• Protect OMONTYS from light. Store OMONTYS vials or pre-filled syringes in their cartons until time of use.

• Do not use if tamper-evident seal on carton is broken or missing.

• Do not dilute OMONTYS and do not administer in conjunction with other drug solutions.

• OMONTYS should be inspected visually for particulate matter and coloration prior to administration. Do not use any vials or pre-filled syringes of OMONTYS exhibiting particulate matter or a coloration other than colorless to slightly yellow.

4 CONTRAINDICATIONS

OMONTYS is contraindicated in patients with:

• Uncontrolled hypertension [see Warnings and Precautions (5.3)].
5 Warnings and Precautions

5.1 Increased Mortality, Myocardial Infarction, Stroke, and Thromboembolism

- In controlled clinical trials of other ESAs in patients with CKD comparing higher hemoglobin targets (13 - 14 g/dL) to lower targets (9 - 11.3 g/dL) (see Table 2), increased risk of death, myocardial infarction, stroke, congestive heart failure, thrombosis of hemodialysis vascular access, and other thromboembolic events was observed in the higher target groups.

- Using ESAs to target a hemoglobin level of greater than 11 g/dL increases the risk of serious adverse cardiovascular reactions and has not been shown to provide additional benefit. Use caution in patients with coexistent cardiovascular disease and stroke [see Dosage and Administration (2.2)]. Patients with CKD and an insufficient hemoglobin response to ESA therapy may be at even greater risk for cardiovascular reactions and mortality than other patients. A rate of hemoglobin rise of greater than 1 g/dL over 2 weeks may contribute to these risks.

- In controlled clinical trials of ESAs in patients with cancer, increased risk for death and serious adverse cardiovascular reactions was observed. These adverse reactions included myocardial infarction and stroke.

- In controlled clinical trials, ESAs increased the risk of death in patients undergoing coronary artery bypass graft surgery (CABG) and deep venous thrombosis (DVT) was observed in patients undergoing orthopedic procedures.

The design and overall results of 3 large trials comparing higher and lower hemoglobin targets are shown in Table 2 (Normal Hematocrit Study (NHS), Correction of Hemoglobin Outcomes in Renal Insufficiency (CHOIR) and Trial to Reduce Cardiovascular Events with Aranesp® Therapy (TREAT)).

Patients with Chronic Kidney Disease Not on Dialysis

OMONTYS is not indicated and is not recommended for the treatment of anemia in patients with CKD who are not on dialysis.

A higher percentage of patients (22%) who received OMONTYS experienced a composite cardiovascular safety endpoint event compared to 17% who received darbepoetin alfa in two randomized, active-controlled, open-label, multi-center trials of 983 patients with anemia due to CKD who were not on dialysis. The trials had a pre-specified, prospective analysis of a composite safety endpoint consisting of death, myocardial infarction, stroke, or serious adverse events of congestive heart failure, unstable angina or arrhythmia (hazard ratio 1.32, 95% CI: 0.97, 1.81).

5.2 Increased Mortality and/or Increased Risk of Tumor Progression or Recurrence in Patients with Cancer receiving ESAs

OMONTYS is not indicated and is not recommended for reduction of RBC transfusions in patients receiving treatment for cancer and whose anemia is not due to CKD because ESAs have shown harm in some settings and the benefit-risk factors for OMONTYS in this setting have not been evaluated.
The safety and efficacy of OMONTYS have not been established for use in patients with anemia due to cancer chemotherapy. Results from clinical trials of ESAs in patients with anemia due to cancer therapy showed decreased locoregional control, progression-free survival and/or decreased overall survival. The findings were observed in clinical trials of other ESAs administered to patients with: breast cancer receiving chemotherapy, advanced head and neck cancer receiving radiation therapy, lymphoid malignancy, cervical cancer, non-small cell lung cancer, and with various malignancies who were not receiving chemotherapy or radiotherapy.

5.3 Hypertension
OMONTYS is contraindicated in patients with uncontrolled hypertension.

Appropriately control hypertension prior to initiation of and during treatment with OMONTYS. Reduce or withhold OMONTYS if blood pressure becomes difficult to control. Advise patients of the importance of compliance with antihypertensive therapy and dietary restrictions [see Patient Counseling Information (17)].

5.4 Lack or Loss of Response to OMONTYS
For lack or loss of hemoglobin response to OMONTYS, initiate a search for causative factors (e.g., iron deficiency, infection, inflammation, bleeding). If typical causes of lack or loss of hemoglobin response are excluded, evaluate the patient for the presence of antibodies to peginesatide. In the absence of antibodies to peginesatide, follow dosing recommendations for management of patients with an insufficient hemoglobin response to OMONTYS therapy [see Dosage and Administration (2.2)].

Contact Affymax, Inc. (1-855-466-6689) to perform assays for binding and neutralizing antibodies.

5.5 Dialysis Management
Patients may require adjustments in their dialysis prescriptions after initiation of OMONTYS. Patients receiving OMONTYS may require increased anticoagulation with heparin to prevent clotting of the extracorporeal circuit during hemodialysis.

5.6 Laboratory Monitoring
Evaluate transferrin saturation and serum ferritin prior to and during OMONTYS treatment. Administer supplemental iron therapy when serum ferritin is less than 100 mcg/L or when serum transferrin saturation is less than 20% [see Dosage and Administration (2.1)]. The majority of patients with CKD will require supplemental iron during the course of ESA therapy. Following initiation of therapy and after each dose adjustment, monitor hemoglobin every 2 weeks until the hemoglobin is stable and sufficient to minimize the need for RBC transfusion. Thereafter, hemoglobin should be monitored at least monthly provided hemoglobin levels remain stable.

6 ADVERSE REACTIONS
The following serious adverse reactions observed during clinical trials with OMONTYS are discussed in greater detail in other sections of the labeling:

- Increased Mortality, Myocardial Infarction, Stroke, and Thromboembolism [see Warnings and Precautions (5.1)]
- Hypertension [see Warnings and Precautions (5.3)]

6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical studies of OMONTYS cannot be directly compared to rates in the clinical trials of other drugs and may not reflect the rates observed in practice.
Patients with Chronic Kidney Disease

Adverse reactions were determined based on pooled data from two active controlled studies of 1066 dialysis patients treated with OMONTYS and 542 treated with epoetin, including 938 exposed for at least 6 months and 825 exposed for greater than one year to OMONTYS. The population for OMONTYS was 20 to 93 years of age, 58.5% male, and the percentages of Caucasian, Black (including African Americans), and Asian patients were 57.9%, 37.4%, and 3.1%, respectively. The median weight adjusted dose of OMONTYS was 0.07 mg/kg and 113 U/week/kg of epoetin.

Table 3 summarizes the most frequent adverse reactions (≥ 10%) in dialysis patients treated with OMONTYS.

Table 3 Adverse Reactions Occurring in ≥ 10% of Dialysis Patients treated with OMONTYS

</table>
Seizures have occurred in patients participating in OMONTYS clinical studies. During the first several months following initiation of OMONTYS, blood pressure and the presence of premonitory neurologic symptoms should be monitored closely.

Advise patients to contact their healthcare practitioner for new-onset seizures, premonitory symptoms, or change in seizure frequency.

Allergic reactions have been reported in patients treated with OMONTYS. Discontinue OMONTYS and administer appropriate therapy if a serious allergic, anaphylactic or infusion-related reaction occurs.

6.2 Immunogenicity

Of the 2357 patients tested, 29 (1.2%) had detectable levels of peginesatide-specific binding antibodies. There was a higher incidence of peginesatide-specific binding antibodies in patients dosed subcutaneously (1.9%) as compared to those dosed intravenously (0.7%). Peginesatide neutralizing antibodies were detected in vitro using a cell-based functional assay in 21 of these patients (0.9%). In approximately half of all antibody-positive patients, the presence of antibodies was associated with declining hemoglobin levels, the requirement for increased doses of OMONTYS to maintain hemoglobin levels, and/or transfusion for anemia of CKD. No cases of pure red cell aplasia (PRCA) developed in patients receiving OMONTYS during clinical trials.

7 DRUG INTERACTIONS

No formal drug/drug interaction studies have been performed. Peginesatide does not bind to serum albumin or lipoproteins as demonstrated in in vitro protein binding studies in rat, monkey and human sera. In vitro studies conducted with human hepatocytes or microsomes have shown no potential for peginesatide to induce or inhibit CYP450 enzymes.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category C

There are no adequate and well-controlled studies in pregnant women. Peginesatide was teratogenic and caused embryofetal lethality when administered to pregnant animals at doses and/or exposures that resulted in polycythemia. OMONTYS should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Administration of peginesatide by intravenous injection to rats and rabbits during organogenesis was associated with embryofetal toxicity and malformations. Dosing was every third day in rats for a total of 5 doses and every fifth day in rabbits for a total of 3 doses (0.01 to 50 mg/kg/dose). In rats and rabbits, adverse embryofetal effects included reduced fetal weight, increased resorption, embryofetal lethality, cleft palate (rats only), sternum anomalies, unossification of sternebrae and metatarsals, and reduced ossification of some bones. Embryofetal toxicity was evident in rats at peginesatide doses of ≥ 1 mg/kg and the malformations (cleft palate and sternoschisis, and variations in blood vessels) were mostly evident at doses of ≥ 10 mg/kg. The dose of 1 mg/kg results in exposures (AUC) comparable to those in humans after intravenous administration at a dose of 0.35 mg/kg in patients on dialysis. In a separate embryofetal developmental study in rats, reduced fetal weight and reduced ossification were seen at a lower dose of 0.25 mg/kg. Reduced fetal weight and delayed ossification in rabbits were observed at ≥ 0.5 mg/kg/dose of peginesatide. In a separate embryofetal developmental study in rabbits, adverse findings were observed at lower doses and included increased incidence of fused sternebrae at 0.25 mg/kg. The effects in rabbits were observed at doses lower (5% - 50%) than the dose of 0.35 mg/kg in patients.
8.3 Nursing Mothers
It is not known whether peginesatide is excreted in human milk. Because many drugs are excreted into human milk, caution should be exercised when OMONTYS is administered to a nursing woman.

8.4 Pediatric Use
The safety and efficacy of OMONTYS in pediatric patients have not been established.

8.5 Geriatric Use
Of the total number of dialysis patients in Phase 3 clinical studies of OMONTYS, 32.5% were age 65 and over, while 13% were age 75 and over. No overall differences in safety or effectiveness were observed between these subjects and younger subjects.

10 OVERDOSAGE
OMONTYS overdosage can elevate hemoglobin levels above the desired level, which should be managed with discontinuation or reduction of OMONTYS dosage and/or with phlebotomy, as clinically indicated [see Pharmacodynamics (12.2)]. Cases of severe hypertension have been observed following overdose with ESAs [see Warnings and Precautions (5.3)].

11 DESCRIPTION
Peginesatide is an ESA that is a synthetic, pegylated dimeric peptide comprised of two identical, 21-amino acid chains covalently bonded to a linker derived from iminodiacetic acid and β-alanine. Peginesatide is manufactured as an acetate salt. The dimeric peptide (approximate MW 4,900 daltons) is covalently linked to a single lysine-branched bis-(methoxypoly(ethylene glycol)) (PEG) chain (approximate MW 40,000 daltons). The structure is provided in Figure 1; peginesatide has no amino acid sequence homology to erythropoietin. The empirical formula is C₂₀₃₁H₃₉₅₀N₆₂O₉₅₈S₆ (free base). The total molecular weight is approximately 45,000 daltons.

Figure 1: Structure of peginesatide acetate

OMONTYS (peginesatide) Injection is formulated as a sterile, colorless to slightly yellow preservative-free solution and a sterile, colorless to slightly yellow preserved solution for intravenous or subcutaneous administration.

Single use, preservative-free injectable solutions of OMONTYS in vials and pre-filled syringes are supplied in multiple strengths. Each 0.5 mL vial or pre-filled syringe contains peginesatide, 23.5 mg sorbitol, 1.5 mg sodium phosphate monobasic (dihydrate), 0.06 mg sodium phosphate dibasic, 0.02 mg polysorbate 20, and water for injection, USP. Sodium hydroxide added to adjust pH. The pH is 6.0 ± 0.3.

Multiple use, preserved injectable solutions of OMONTYS in vials are supplied in two fill volumes: 1 mL and 2 mL. Each mL contains 10 mg peginesatide, 47 mg sorbitol, 5 mg phenol, 1.5 mg L-methionine, 0.6 mg glacial acetic acid, and water for injection, USP. Sodium hydroxide added to adjust pH. The pH is 5.4 ± 0.5.
12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Peginesatide binds to and activates the human erythropoietin receptor and stimulates erythropoiesis in human red cell precursors in vitro.

12.2 Pharmacodynamics

Peginesatide increases the reticulocyte count, followed by increases in hemoglobin. The rate of hemoglobin increase varies among patients and is dependent upon the dose of peginesatide administered.

Effect on Cardiac Repolarization

The effect of OMONTYS (0.1 mg/kg intravenously) on QTc interval was evaluated in a randomized, double-blind, double-dummy, three-period crossover thorough QT study in 56 healthy subjects. A dose of 0.1 mg/kg administered intravenously did not delay cardiac repolarization compared to placebo. The dose of 0.1 mg/kg is adequate to represent the median dose (0.07 mg/kg) in the phase 3 trials, however is not sufficient to represent doses higher than 0.1 mg/kg in the intended patients.

12.3 Pharmacokinetics

Following single intravenous and subcutaneous injections at doses ranging from 0.03 to 0.1 mg/kg to dialysis patients, maximal plasma concentration (Cmax) and area under the plasma concentration versus time curve (AUC) increase with dose. Following subcutaneous administration, the maximum concentrations of peginesatide are reached in approximately 48 hours. The bioavailability of peginesatide following subcutaneous administration is approximately 46%.

No mass balance study has been conducted in humans. Preclinical radiolabeled peginesatide study indicated that peginesatide is not metabolized and that urinary excretion was the predominant route of elimination following either intravenous or subcutaneous dosing.

The mean half-life is 25.0 ± 7.6 hours following intravenous administration and 53.0 ± 17.7 hours following subcutaneous administration in healthy subjects. The mean half-life in dialysis patients is 47.9 ± 16.5 hours following intravenous administration. Mean systemic clearance is 0.5 ± 0.2 mL/hr·kg and mean volume of distribution is 34.9 ± 13.8 mL/kg following intravenous administration in dialysis patients. No accumulation is observed following administration every 4 weeks following intravenous or subcutaneous administration. The pharmacokinetics of peginesatide in patients with CKD on dialysis are not altered by age, gender or race based on population pharmacokinetic analyses.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Peginesatide was not carcinogenic in a 2-year study in rats at doses up to 0.25 mg/kg administered every 3 weeks by intravenous injection. This dose is approximately 14% the human exposure (AUC) at a dose of 0.35 mg/kg in patients on dialysis. Peginesatide was not carcinogenic in a 26-week study in rasH2 transgenic mice when administered by intravenous injection at doses of 0.1, 0.25, or 0.5 mg/kg/dose every 3 weeks.

Peginesatide was not mutagenic or clastogenic in the in vitro Ames assay, in vitro mammalian chromosome aberration assay, and an in vivo mouse erythrocyte micronucleus assay.

When peginesatide was administered intravenously to male and female rats at weekly intervals prior to and during mating, and treated rats mated, fertility was reduced at ≥ 0.1 mg/kg (approximately 5% of the dose of 0.35 mg/kg in patients) and was most evident at doses
≥ 1.0 mg/kg of peginesatide. Adverse effects in males included reduced weight of seminal vesicles and prostate. Decreased viable fetuses at ≥ 0.1 mg/kg in females appeared to be due to pre- and post-implantation losses. There was no apparent drug-related effect on estrous cycles or number of corpora lutea.

14 CLINICAL STUDIES

The efficacy and safety of OMONTYS in patients with CKD on dialysis were demonstrated in two randomized, active-controlled, open-label, multi-center clinical studies that evaluated OMONTYS in the maintenance of hemoglobin concentrations in patients who were being treated with another ESA (epoetin alfa or epoetin beta) at the time of study entry. The primary efficacy endpoint for each study was the change in hemoglobin from Baseline to the Evaluation Period (Weeks 29 to 36) using a non-inferiority comparison with epoetin. In Study 1, patients received epoetin via the intravenous route of administration and continued to use this route after randomization to either OMONTYS or epoetin. The average patient exposure year [PEY] per patient was 1.14 years for OMONTYS and the average PEY per patient was 1.25 years for epoetin. In Study 2, the route of administration previously used for epoetin (intravenous or subcutaneous) was used. The average PEY per patient was 1.17 years for OMONTYS and the average PEY per patient was 1.16 years for epoetin. The median dose of OMONTYS was 0.07 mg/kg administered once monthly and the median dose of epoetin was 113 units/kg administered weekly (in 1 to 3 doses).

Patients were randomized (2 to 1) to receive OMONTYS once monthly, or to continue on their current ESA treatment 1 to 3 times per week. The OMONTYS starting dose was based on the patient's total weekly ESA dose during the last week of the screening period. As shown in Table 4, treatment with OMONTYS once monthly and treatment with epoetin 1-3 times per week maintained hemoglobin concentrations within the study pre-specified hemoglobin range (10 to 12 g/dL). In both studies, the proportion of patients receiving transfusions was similar in each treatment group.

</table>

Studies 1 and 2 had a pre-specified, prospective, pooled analysis of a composite cardiovascular safety endpoint consisting of death, myocardial infarction, stroke, or serious adverse events of congestive heart failure, unstable angina or arrhythmia. In patients receiving OMONTYS, 22.8% experienced one of these events compared to 24.4% receiving epoetin (hazard ratio 0.95, 95% CI 0.77, 1.17).

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

OMONTYS is available in single use vials, single use pre-filled syringes, and multiple use vials. The vial caps and plungers of the pre-filled syringes are designated with unique colors for each dosage strength. The single use pre-filled syringes are supplied with a 27 gauge, ½ inch needle.
To reduce the risk of accidental needle sticks after application, each single use pre-filled syringe is equipped with a safety device that activates and covers the needle once the dose has been given.

OMONTYS is available in the following pack sizes:

<table>
<thead>
<tr>

</table>

16.2 Stability and Storage

The recommended storage temperature is refrigerated at 2 °C to 8 °C (36 °F to 46 °F). Protect from light. Retain in carton until time of use.

Storage of single use vials, single use pre-filled syringes or multiple use vials over the recommended temperature (2 °C to 8 °C), when necessary, is permissible only for temperatures up to 25 °C (77 °F) and for no more than 30 days.

After first use, the multiple use vials should be stored at 2 °C to 8 °C, and then discarded after 28 days.

17 PATIENT COUNSELING INFORMATION

See FDA-approved patient labeling (Medication Guide).

Prior to treatment, inform patients of the risks and benefits of OMONTYS.

Inform patients:

- To read the Medication Guide and to review and discuss any questions or concerns with their healthcare provider before starting OMONTYS and at regular intervals while receiving OMONTYS.
- Of the increased risks of mortality, serious cardiovascular reactions, thromboembolic reactions, stroke, and tumor progression [see Warnings and Precautions (5.1, 5.2)].
- To undergo regular blood pressure monitoring, adhere to prescribed anti-hypertensive regimen and follow recommended dietary restrictions.
- To contact their healthcare provider for new-onset neurologic symptoms or change in seizure frequency.
- Of the need to have regular laboratory tests for hemoglobin.

Administer OMONTYS under the direct supervision of a healthcare provider or, in situations where a patient has been trained to administer OMONTYS at home, provide instruction on the proper use of OMONTYS, including instructions to:
- Carefully review the Medication Guide and the Instructions for Use
- Avoid the reuse of needles, syringes, or unused portions of the OMONTYS single use vials or single use pre-filled syringes and properly dispose of these items
- Always keep a puncture-proof disposal container available for the disposal of used syringes and needles.

PEG096 R1
Read this Medication Guide:
- before you start OMONTYS.
- if you are told by your healthcare provider that there is new information about OMONTYS.
- if you are told by your healthcare provider that you may inject OMONTYS at home, read this Medication Guide each time you receive a new supply of medicine.

This Medication Guide does not take the place of talking to your healthcare provider about your medical condition or your treatment. Talk with your healthcare provider regularly about the use of OMONTYS and ask if there is new information about OMONTYS.

What is the most important information I should know about OMONTYS?

Using OMONTYS or other erythropoiesis-stimulating agents (ESAs) can lead to serious side effects including death.

- If you decide to take OMONTYS, your healthcare provider should prescribe the smallest dose of OMONTYS that is needed to reduce your chance of needing red blood cell transfusions.
- You may get serious heart problems such as heart attack, stroke, heart failure, and may die sooner if you are treated with OMONTYS to reach a normal or near-normal hemoglobin level.
- You may get blood clots while receiving OMONTYS. If you are receiving OMONTYS and you are going to have surgery, talk to your healthcare provider about whether or not you need to take a blood thinner to lessen the chance of blood clots during or following surgery. Clots can form in blood vessels (veins), especially in your leg (deep venous thrombosis or DVT). Pieces of a blood clot may travel to the lungs and block the blood circulation in the lungs (pulmonary embolus).

Call your healthcare provider or get medical help right away if you have any of these symptoms of blood clots:
- Chest pain
- Trouble breathing or shortness of breath
- Pain in the legs, with or without swelling
- A cool or pale arm or leg
- Sudden confusion, trouble speaking, or understanding others’ speech
• Sudden numbness or weakness of the face, arm, or leg, especially on one side of your body
• Sudden trouble seeing
• Sudden trouble walking, dizziness, loss of balance or coordination
• Loss of consciousness (fainting)
• Hemodialysis vascular access stops working.

See “What are the possible side effects of OMONTYS?” below.

What is OMONTYS?
OMONTYS is a prescription medicine that works like the human protein erythropoietin. OMONTYS is given to treat anemia (low red blood cells) in adults with chronic kidney disease (CKD) who are on dialysis.

OMONTYS stimulates your bone marrow to make more red blood cells. Having more red blood cells raises your hemoglobin level. If your hemoglobin level stays too high or if your hemoglobin goes up too quickly, this may lead to serious health problems which may result in death. These serious health problems may happen even if you take OMONTYS and do not have an increase in your hemoglobin level.

OMONTYS should not be used for the treatment of anemia:
• if you have chronic kidney disease (CKD) and are not on dialysis,
• if you are receiving treatment for cancer and your anemia is not caused by CKD,
• in place of emergency treatment for anemia (red blood cell transfusions).

OMONTYS has not been proven to improve the quality of life, fatigue, or well-being.

It is not known if OMONTYS is safe and effective in children.

Who should not use OMONTYS?
Do not use OMONTYS if you have high blood pressure that is not controlled (uncontrolled hypertension).

What should I tell my healthcare provider before using OMONTYS?
Before using OMONTYS tell your healthcare provider if you:
• have heart disease
• have or develop cancer
• have high blood pressure
• have any history of stroke, blood clot or seizure (convulsion)
• have blood disorders (such as sickle cell anemia or clotting disorders)
• have any other medical conditions
• are pregnant or plan to become pregnant. It is not known if OMONTYS will harm your unborn baby.
are breastfeeding or plan to breastfeed. It is not known if OMONTYS passes into your breast milk.

Tell your healthcare provider about all of the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.

Know the medicines you take. Keep a list of your medicines with you and show it to your healthcare provider when you get a new medicine.

How should I use OMONTYS?

- Continue to follow your healthcare provider’s instructions for diet, dialysis, and medicines, including medicines for high blood pressure, while using OMONTYS.
- Have your blood pressure checked as instructed by your healthcare provider.
- Your healthcare provider should do blood tests to check your hemoglobin and iron levels before and during your treatment with OMONTYS.
- OMONTYS is given one time a month into the vein, through your hemodialysis vascular access (intravenous), or under your skin (subcutaneous).
- OMONTYS should be given by your healthcare provider. In some cases, your healthcare provider may allow you or your caregiver to give the injections at home.
- If you or your caregiver has been trained to give the injections at home, it is important that you:
  - Carefully follow the instructions that your healthcare provider gives you. **Be sure that you read, understand, and follow the “Instructions for Use” that come with OMONTYS.**
  - Use OMONTYS exactly as your healthcare provider tells you to. Do not change the dose of OMONTYS unless told to do so by your healthcare provider.
  - Your healthcare provider will show you or your caregiver how much OMONTYS to use, how to inject it, how often it should be injected and how to safely dispose of the used containers, needles and syringes.
  - If you miss a dose of OMONTYS, call your healthcare provider right away for instructions on what to do.
  - If you inject more than the prescribed amount of OMONTYS, call your healthcare provider right away for instructions on what to do.
What are the possible side effects of OMONTYS?

OMONTYS may cause serious side effects, including:

- **See “What is the most important information I should know about OMONTYS?”**

- **High blood pressure.** High blood pressure is a common side effect of OMONTYS in people with chronic kidney disease. Your blood pressure may go up or be difficult to control with blood pressure medicine while taking OMONTYS. This can happen even if you have never had high blood pressure before. Your healthcare provider should check your blood pressure often. If your blood pressure does increase, your healthcare provider may prescribe new or more blood pressure medicine.

- **Antibodies to OMONTYS.** Your body may make antibodies to OMONTYS. These antibodies can block or lessen your body’s ability to make red blood cells and cause you to have severe anemia. Call your healthcare provider if you have unusual tiredness, lack of energy, dizziness, or fainting. You may need to stop taking OMONTYS.

The most common side effects of OMONTYS include:

- shortness of breath
- diarrhea
- nausea
- vomiting
- cough
- problems with your hemodialysis access
- headache
- muscle spasms
- joint, back, leg, or arm pain
- low blood pressure (hypotension)
- fever
- increase in blood potassium level
- upper respiratory infection

Tell your healthcare provider if you have any side effect that bothers you or that does not go away.

These are not all the possible side effects of OMONTYS. For more information, ask your healthcare provider or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store OMONTYS?

- Keep OMONTYS in the original package.
- Protect OMONTYS from light.
- Store OMONTYS in the refrigerator between 36 °F to 46 °F (2 °C to 8 °C).
- If a refrigerator is not available, OMONTYS vials and pre-filled syringes can be stored at 77 °F or less (25 °C or less) for up to 30 days.
- Throw away multiple use vials of OMONTYS no later than 28 days from the first day that you put a needle into the vial.
• OMONTYS single use vials and pre-filled syringes should be used only one time. Dispose of the single use vial and the pre-filled syringe after use even if there is medicine left in the container.

Keep OMONTYS and all medicines out of the reach of children.

General Information about the safe and effective use of OMONTYS
Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use OMONTYS for a condition for which it was not prescribed. Do not give OMONTYS to other people, even if they have the same symptoms that you have. It may harm them.

This Medication Guide summarizes the most important information about OMONTYS. If you would like more information about OMONTYS, talk with your healthcare provider. You can ask your healthcare provider or pharmacist for information about OMONTYS that is written for healthcare professionals.

For more information go to www.omontys.com or call 1-855-466-6689.

What are the ingredients in OMONTYS?
Active ingredient: peginesatide

Inactive ingredients:
• Single Use Vials and Single Use Pre-filled Syringes: sorbitol, sodium phosphate monobasic (dihydrate), sodium phosphate dibasic, polysorbate 20, and sodium hydroxide in Water for Injection.
• Multiple Use Vials: sorbitol, phenol, L-methionine, glacial acetic acid, and sodium hydroxide in Water for Injection.

This Medication Guide has been approved by the U.S. Food and Drug Administration.

PEG097 R1  March 2012
Instructions for Use
OMONTYS® (O-mon-tis)
(peginesatide)
Injection
Single use vials
Multiple use vials

Use these instructions if you or your caregiver has been trained to give OMONTYS injections at home. Do not give yourself the injection unless you have received training from your healthcare provider. If you are not sure about giving the injection or if you have questions, ask your healthcare provider for help.

Before reading these Instructions for Use, read the Medication Guide that comes with OMONTYS for the most important information you need to know.

When you receive your OMONTYS vial and syringes, make sure that:

- The name OMONTYS appears on the carton and vial label.
- The tamper evident seal on the carton is not damaged. Do not use if the tamper evident seal on carton is broken or missing.
- OMONTYS is used before the expiration date on the vial label. Do not use OMONTYS on or after the expiration date on the label.
- The dose strength of the OMONTYS vial (number of mg (milligrams) per mL (milliliter) on the vial label) is the same as your healthcare provider prescribed.
- You understand what the dose strength of OMONTYS means. OMONTYS vials come in different dose strengths. For example, the dose strength may be described as 10 mg/mL on the vial label. This means that there is 10 mg of medicine in each 1 mL of liquid. Your healthcare provider may also refer to a mL as a “cc”. One mL is the same as one “cc”.
- The OMONTYS liquid in the vial is clear and colorless to slightly yellow. Do not use OMONTYS if the liquid in the vial looks discolored or cloudy, or if the liquid has lumps, flakes or particles.
- The OMONTYS vial has a colored cap on the top of the vial of OMONTYS. Do not use the vial of OMONTYS if the colored cap has been removed or is missing.
- Use only the type of disposable syringe and needle that your healthcare provider has prescribed.
- Keep OMONTYS away from light. Store OMONTYS vials in their cartons in the refrigerator between 36 °F to 46 °F (2 °C to 8 °C) until time of use.
- Single-use vials of OMONTYS should be used only one time. Dispose of the vial after one use even if there is medicine left in the vial.
• After removing a dose from the multiple use vial, store the vial in the refrigerator (but not in the freezer) in its carton to protect from light. Do not store the vial for more than 28 days.

• Store unused portion of OMONTYS in the multiple use vials in the refrigerator between 36 °F to 46 °F (2 °C to 8 °C).

• Throw away the multiple use vial as directed by your healthcare provider if it has been more than 28 days since you first put a needle into the multiple use vial.

How should I prepare for an injection of OMONTYS?
Your healthcare provider should show you how to give the correct dose of OMONTYS:

• Always keep an extra syringe and needle on hand.
• Follow your healthcare provider’s instructions on how to measure your dose of OMONTYS.
• Only use disposable syringes and needles that your healthcare provider prescribed. If you do not use the correct syringe, you could inject too much or too little OMONTYS.
• Be sure you know which line on the syringe matches the dose of OMONTYS that your healthcare provider prescribed. Use a syringe and needle only one time and then dispose of them as instructed by your healthcare provider.

What do I need to know about the different types of OMONTYS vials?
OMONTYS comes in two different types of vials.

• Single use vials
• Multiple use vials

Important: Follow these instructions exactly to help avoid infections.

1. Prepare a clean, flat work surface.
2. Gather the supplies you will need for an injection (see Figure A). You will need:
   • OMONTYS vial and the correct disposable syringe and needle
   • Alcohol wipes and cotton ball or gauze
   • Puncture-proof disposable container for safely disposing of the needle and syringe after injection
3. Take a carton of OMONTYS from the refrigerator.
4. Take the vial of OMONTYS out of its carton and place it on your flat work surface.
5. Check the date on the OMONTYS vial to be sure that the medicine has not expired.
6. Do not use a single use vial of OMONTYS more than one time.
7. Wash your hands well with soap and warm water before preparing the dose (see Figure B).

Figure A

Figure B
Preparing the dose of OMONTYS

1. Remove the protective flip-off colored cap from the vial. Leave the rubber stopper on the vial (see Figure C).

![Figure C](image)

2. Clean the rubber stopper with one alcohol wipe and put the vial on your flat work surface (see Figure D).

![Figure D](image)

3. Check the package containing the disposable syringe. If the syringe package is not damaged, open it and take out the syringe. If the package is damaged or has already been opened, do not use that syringe. Dispose of the syringe in the puncture-proof disposable container and get a new one.

4. Pull off the needle cover carefully (see Figure E). Always use the syringe and needle that has been recommended by your healthcare provider.
5. Pull back on the plunger to the line on the syringe that matches the dose instructions of OMONTYS that your healthcare provider has given you (see Figure F).

6. Keep the vial on your flat work surface and insert the needle straight through the center of the rubber stopper of the OMONTYS vial (see Figure G).
7. Push down on the plunger of the syringe to inject the air from the syringe into the vial. The air injected into the vial will allow OMONTYS to be easily withdrawn into the syringe (see Figure H).

![Figure H]

8. Keep the needle inside the vial. Turn the vial upside down. Keep the vial upside down and make sure that the tip of the needle remains below the surface of the OMONTYS liquid. Slowly pull back on the plunger to fill the syringe with OMONTYS liquid to the number (mL or cc) on the syringe that matches the dose your healthcare provider has given you (see Figure I).

![Figure I]

9. Keep the needle in the vial. Check for air bubbles in the syringe. Small air bubbles are harmless, but too large an air bubble will not let you draw up the right amount of OMONTYS.

   a. To remove air bubbles, gently tap the syringe with your fingers until the air bubbles rise to the top of the syringe.

   b. Slowly push on the plunger to push the air bubbles out of the syringe and back into the vial (see Figure J).
c. If you have pushed any liquid back into the vial, pull the plunger back slowly to the line on the syringe that matches your dose while making sure the tip of the needle is below the surface the liquid. Check again for air bubbles. If there are still air bubbles, remove them by repeating Step 8 (see Figure K).

10. Check again to make sure you have the right dose. Put the vial on its side with the needle still in it. This will keep the needle from touching anything before you use it (see Figure L).
Selecting and preparing the injection site:
OMONTYS can be injected into your body using two different ways (routes) as described below. Follow your healthcare provider’s instructions about how you should inject OMONTYS.

Subcutaneous Route:
OMONTYS can be injected under your skin. This is called a subcutaneous injection. When giving subcutaneous injections, follow your healthcare provider’s instructions about changing the site for each injection.

1. Choose one injection site from those shown in Figure M. The four sites where you can inject OMONTYS include:
   - The outer area of the upper arms
   - The front of the middle thighs
   - The abdomen (except for the two inch area around the navel)
   - The upper outer area of the buttocks

Do not inject OMONTYS into an area on your body that is tender, red, bruised, hard, or that has scars or stretch marks.

![Figure M](image-url)
2. Clean the injection site with an alcohol wipe. Do not touch this area again before giving the injection (see Figure N).

![Figure N](image)

3. Check that the correct amount of OMONTYS is in the syringe.

4. Remove the prepared syringe and needle from the vial of OMONTYS and hold it in the hand that you will use to inject the medicine. Use the other hand to pinch a fold of skin at the cleaned injection site. Do not touch the cleaned area of skin (see Figure O).

![Figure O](image)

5. Hold the syringe like you would hold a pencil. Insert the needle in a quick “dart like” motion. Insert the needle either at a slight angle (45 degree angle) or straight up and down (90 degree angle) into the skin. Inject the prescribed dose by pushing the plunger all the way down as directed by your healthcare provider, nurse or pharmacist (see Figure P).
6. Pull the needle out of your skin. Do not recap the needle. Place a cotton ball or gauze over the injection site and press gently for several seconds. Do not rub (see Figure Q).

7. Dispose of the used syringe and needle as described below. Do not reuse the syringes and needles.

**Intravenous Route:**

- OMONTYS can be injected in your vein through a special access port on the dialysis tubing while dialysis is underway. This type of OMONTYS injection is called an intravenous injection. This route is usually for hemodialysis patients.
- If you have a hemodialysis vascular access, make sure it is working by checking it as your healthcare provider has shown you. Be sure to let your healthcare provider know right away if you are having any problems, or if you have any questions.
Peritoneal Dialysis Patients: If you are a peritoneal dialysis patient, administer OMONTYS only by subcutaneous route under your skin (See Subcutaneous Route section above)

1. Clean the venous port of the hemodialysis tubing with an alcohol wipe (see Figure R).

![Figure R](image)

2. Insert the needle of the syringe into the cleaned venous port and push the plunger all the way down to inject all the OMONTYS (see Figure S).

![Figure S](image)

3. Remove the syringe from the venous port. Do not recap the needle. Dispose of the syringe and needle as described below.

How should I dispose of vials, syringes and needles?

Do not reuse the single-use vials, syringes, or needles. Follow the required state and local laws for disposal of needles and syringes. Ask your healthcare provider or pharmacist about correct disposal of used vials, syringes and needles.

Use the information below as a general guideline:
• Do not put the needle cover back on the needle.
• Place all used needle and syringes in the puncture-proof disposable container with a lid.
• Dispose of the full puncture-proof disposable container as instructed by your healthcare provider or pharmacist.
• Do not dispose of the vial, needle, syringe, or disposable container in the household trash or recycle.
• Do not use glass or clear plastic containers to dispose of the needle and syringe.
• Keep the puncture-proof disposable container out of the reach of children. Do not recycle.
• When the puncture-proof disposable container is full, tape around the cap or lid to make sure the cap or lid does not come off. Throw away the puncture-proof disposable container as instructed by your healthcare provider.

**Keep OMONTYS and all medicines out of reach of children.**

These Instructions for Use have been approved by the U.S. Food and Drug Administration.

Deerfield, IL 60015

PEG098 R1 March 2012
Instructions for Use
OMONTYS® (O-mon-tis)
(peginesatide)
Injection
Single Use Pre-filled Syringe

Use these instructions if you or your caregiver has been trained to give OMONTYS injections at home. Do not give yourself the injection unless you have received training from your healthcare provider. If you are not sure about giving the injection or if you have questions, ask your healthcare provider for help.

Before reading these Instructions for Use, read the Medication Guide that comes with OMONTYS for the most important information you need to know.

When you receive your OMONTYS pre-filled syringe, make sure that:
- The name OMONTYS appears on the carton and pre-filled syringe label.
- The tamper evident seal on the carton is not damaged. Do not use if the tamper evident seal on carton is broken or missing.
- OMONTYS is used before the expiration date on the pre-filled syringe label. Do not use OMONTYS on or after the expiration date on the label.
- The amount of OMONTYS on the pre-filled syringe label matches the amount prescribed (the number of mg (milligrams) per mL (milliliter)) by your healthcare provider.
- The OMONTYS liquid in the pre-filled syringe is clear and colorless to slightly yellow. Do not use OMONTYS if the liquid in the syringe looks discolored or cloudy, or if the liquid has lumps, flakes or particles.
- Store OMONTYS in the refrigerator between 36 °F to 46 °F (2 °C to 8 °C).
- Keep OMONTYS away from light. Store OMONTYS pre-filled syringes in their cartons until time of use.

How should I prepare for an injection of OMONTYS?
- Your healthcare provider should show you how to give the correct dose of OMONTYS.
- Use the pre-filled syringe only one time and dispose of it as instructed by your healthcare provider.

Important: Follow these instructions exactly to help avoid infections.
1. Prepare a clean, flat work surface.
2. Gather the supplies you will need for an injection (see Figure A). You will need:
   - OMONTYS pre-filled syringe
   - Alcohol wipes and cotton ball or gauze
   - Puncture-proof disposable container for safely disposing of the pre-filled syringe after injection

![Image of supplies]

3. Take a carton of OMONTYS from the refrigerator.
4. Take the pre-filled syringe of OMONTYS out of its carton and place it on your flat work surface. Do not remove from wrapper at this point.
5. Use a pre-filled syringe only one time.
6. Wash your hands well with soap and warm water before preparing the dose (see Figure B).
Preparing the dose of OMONTYS

1. Open the wrapper and remove the pre-filled syringe from the tray.
   - Check to see that the needle cover is on and the needle guard is covering only the barrel of the syringe (see Figure C).

   ![Figure C](image)

   - If the needle guard is covering the needle, then it has already been activated (see Figure D). Do not use that syringe. Dispose of the syringe in the puncture-proof disposable container. Use a new pre-filled syringe.

   ![Figure D](image)
2. Hold the syringe with the needle pointing up to prevent the OMONTYS from leaking out of the needle. Pull the needle cover straight off (see Figure E).

![Figure E](image)

3. Check the syringe for air bubbles. If there are air bubbles, gently tap the syringe with your fingers until the air bubbles rise to the top of the syringe. Slowly push the plunger up to force the air bubbles out of the syringe (see Figure F).

![Figure F](image)

4. When you put the syringe down on your flat work surface, be careful not to let the needle touch anything (see Figure G).

![Figure G](image)
Selecting and preparing the injection site

OMONTYS can be injected into your body using two different ways (routes) as described below. Follow your healthcare provider’s instructions about how you should inject OMONTYS.

Subcutaneous Route:

OMONTYS can be injected under your skin. This is called a subcutaneous injection. When giving subcutaneous injections, follow your healthcare provider’s instructions about changing the site for each injection.

1. Choose one injection site from those shown in Figure H. The four sites where you can inject OMONTYS include:
   - The outer area of the upper arms
   - The front of the middle thighs
   - The abdomen (except for the two-inch area around the navel)
   - The upper outer area of the buttocks

Do not inject OMONTYS into an area on your body that is tender, red, bruised, hard, or that has scars or stretch marks.

Figure H

Reference ID: 3107278
2. Clean the injection site with an alcohol wipe. Do not touch this area again before giving the injection (see Figure I).

![Figure I]

3. Hold the pre-filled syringe in the hand that you will use to inject OMONTYS. Use the other hand to pinch a fold of skin at the cleaned injection site. Do not touch the cleaned area of skin (see Figure J).

![Figure J]

4. Hold the pre-filled syringe like you would hold a pencil between the thumb and fore finger with the syringe resting on the middle finger (see Figure K).

![Figure K]
5. Insert the needle in a quick “dart like” motion. Insert the needle either at a slight angle (45 degree angle) or straight up and down (90 degree angle) into the skin. Inject the prescribed dose subcutaneously as directed by your healthcare provider, nurse or pharmacist (see Figure L). The plunger must be fully depressed during injection in order for the needle guard (a safety mechanism to prevent accidental needle sticks) to activate.

Figure L

6. Take the needle out of the skin without releasing the plunger. Let go of the plunger after removing the needle from the skin to allow the syringe to move up until the entire needle is guarded and locks into place (see Figure M).

Figure M

7. Place a cotton ball or gauze over the injection site and press gently for several seconds. Do not rub (see Figure N).
8. Dispose of the used pre-filled syringe as described below. Use the pre-filled syringe one time only.

**Intravenous Route:**
- OMONTYS can be injected in your vein through a special access port on the dialysis tubing while dialysis is underway. This type of OMONTYS injection is called an intravenous injection. This route is usually for hemodialysis patients.
- If you have a hemodialysis vascular access, make sure it is working by checking it as your healthcare provider has shown you. Be sure to let your healthcare provider know right away if you are having any problems, or if you have any questions.

**Peritoneal Dialysis Patients:** If you are a peritoneal dialysis patient, administer OMONTYS only by subcutaneous route under your skin (See subcutaneous route section above)

1. Clean the venous port of the hemodialysis tubing with a new alcohol wipe (see Figure O).
2. Insert the needle of the pre-filled syringe into the cleaned venous port and push the plunger all the way down to inject all the medicine (see Figure P). The plunger must be fully depressed during injection in order for the needle guard (a safety mechanism to prevent accidental needle sticks) to activate.

3. Remove the syringe from the venous port without releasing the plunger. Then, let go of the plunger to allow the syringe to move up until the entire needle is guarded and locks into place.

4. Dispose of the used pre-filled syringe as described below. Use the pre-filled syringe one time only.

**How should I dispose of pre-filled syringes?**

Do not reuse the single use pre-filled syringe. Follow the required state and local laws for disposal of needles and syringes. Ask your healthcare provider or pharmacist about correct disposal of used pre-filled syringes.

Use the information below as a general guideline:

- Do not put the needle cover back on the needle.
- Place all used pre-filled syringes in the puncture-proof disposable container with a lid.
- Dispose of the full puncture-proof disposable container as instructed by your healthcare provider or pharmacist.
- Do not dispose of the pre-filled syringe or disposable container in the household trash or recycle.
- Do not use glass or clear plastic containers to dispose of pre-filled syringes.
- Keep the puncture-proof disposable container out of the reach of children. Do not recycle.
- When the puncture-proof disposable container is full, tape around the cap or lid to make sure the cap or lid does not come off. Throw away the puncture-proof disposable container as instructed by your healthcare provider.

**Keep OMONTYS and all medicines out of reach of children.**
