207924Orig1s000

CHEMISTRY REVIEW(S)

**MEMORANDUM: DEPARTMENT OF HEALTH AND HUMAN SERVICES PUBLIC
HEALTH SERVICE
FOOD AND DRUG ADMINISTRATION
CENTER FOR DRUG EVALUATION AND RESEARCH**

DATE: 06-FEB-2018

TO: N207924 file

FROM: Craig Bertha
CMC Lead
ONDP/DNDP II

THROUGH: Julia Pinto
Acting Branch Chief
ONDP/DNDP II

SUBJECT: Additional CMC data in 04-DEC-2017, Resubmission

SUMMARY and CONCLUSION: The OPQ recommendation for this application at the end of the original review cycle was that the application could be approved, from a CMC perspective. The Agency sent a complete response (CR) action to the applicant. The current 04-DEC-2017, submission is a response to the CR letter.

Although there were no CMC-related comments included in the CR letter, the new submission includes some additional CMC data. Drug product analyses data are provided for an additional 16 new batches (9 at 4 mg and 7 at 2 mg strengths). All of these batches met their specifications. The submission also includes the 18, 24, and 36 month stability data for the primary stability batches of the two strengths. There are also new stability data (up to 18 months with 25°C/60%RH storage and 6 months with 40°C/75%RH storage) for batches of drug product manufactured at the commercial manufacturing facility [Lilly del Caribe, Puerto Rico (PR)]. The applicant will maintain their proposal for a 24 month shelf-life, which was already found acceptable based on the data provided under the previous review cycle. As the updated data show no significant trends for up to 36 months with 30°C/65%RH storage, the 24 month expiry is still acceptable. The new stability data (up to 18 months long term conditions) from the commercial manufacturing site in PR (in bottles and blisters stored at 30°C/65%RH, 30°C/75%RH, and 40°C/75%RH) also demonstrated the drug product to have adequate stability with no significant trending. These data also support the 24 month expiry period when considering the recommendations of ICH Q1E.

The new CMC data submitted with the resubmission does not alter the original recommendation from OPQ to approve the application.

Executive Summary

I. Recommendations and Conclusion on Approvability

Based on the reviews and recommendations from the drug substance, drug product, biopharmaceutics, process, and facilities teams outlined in the review below, an overall recommendation of **approval** is to be forwarded to the clinical Division (DPARP) from the Office of Pharmaceutical Quality. The amended NDA has provided adequate chemistry, manufacturing and controls information to assure the identity, strength, purity, and quality of the drug product, baricitinib tablets. The applicant has responded adequately to all information requests. Associated manufacturing and testing sites supporting this NDA are deemed acceptable by the Office of Process and Facilities (OPF) as of 24-OCT-2016.

The stability information submitted to the NDA supports a 24 months expiration dating period for the drug product under the labeled storage conditions.

II. Summary of Quality Assessment

A. Product Overview

The current application seeks approval for a solid oral dosage form, baricitinib tablets, for the treatment of rheumatoid arthritis. The synthesis of the new molecular entity, baricitinib, (b) (4) is performed by Lilly in Ireland. The immediate release tablet drug product is manufactured using (b) (4).

Proposed Indication(s) including Intended Patient Population	Moderate to severe rheumatoid arthritis (RA)
Duration of Treatment	Chronic
Maximum Daily Dose	Recommended daily dose is 2 or 4 mg/day (QD)
Alternative Methods of Administration	No other routes of administration than oral

B. Quality Assessment Overview

Baricitinib is a new molecular entity for the treatment of rheumatoid arthritis. It is synthesized (b) (4) from acceptable starting materials. There is (b) (4). The crystalline achiral drug substance is practically insoluble in water and slightly soluble at lower pH. During

review there were some questions regarding the testing methods, specification acceptance criteria, retest period, commercial storage conditions, and changes to the synthesis process during development, but these issues have been adequately addressed by the applicant.

The immediate release tablet drug product has two strengths, 2 and 4 mg, and these dosage forms are prepared with common compendial grade excipients. Tablet manufacture consists of (b) (4)

. During review of the drug product and process, there were questions regarding details of the process description that were not outlined in the application, inadequate in-process controls for (b) (4), out-of-trend results for microbial data, and (b) (4) end product content uniformity. In addition, the applicant provided additional data regarding drug product packaging components and testing of colorants for distinguishing between the two strengths. Based on the evaluation of the applicant's responses to information requests about these issues, the drug product and process review teams have found these aspects of the application to be adequate.

The biopharmaceutics team has found the applicant's dissolution method to be discriminating, and the specification acceptance criterion for dissolution to be acceptable, from a quality control perspective.

The facilities review team has evaluated three sites for the commercial production of the drug product: one drug substance synthesis site (profile class CSN), a drug product production site, and a final packaging site. Based on file review and pre-approval inspections, there are no outstanding facilities issues and all sites are found to be acceptable.

BIOPHARMACEUTICS**Product Background:****NDA/ANDA:** NDA 207924**Drug Product Name / Strength:** Baricitinib (LY3009104) tabs 2 mg and 4 mg**Route of Administration:** Oral**Applicant Name:** Eli Lilly and Company***Dissolution Method and Acceptance Criteria***

The proposed drug products Baricitinib (OLUMIANT™) 2 mg and 4 mg are immediate release (IR) tablets. The Applicant seeks approval of this NDA via the 505(b)(1) regulatory pathway for the treatment of adult patients with moderately to severely active rheumatoid arthritis.

1. Composition of proposed drug product:

The quantitative composition and function of each component of commercial baricitinib (LY3009104) tablets are listed in the Table 1. Both the formulations are proportionally similar.

Table 1: Composition of baricitinib commercial tablets 2 mg and 4 mg (from M.2.3.P)

Ingredient	Quantity (mg/Tablet)		Function
	2 mg	4 mg	
Active Ingredient			
Baricitinib	2.000	4.000	Active Ingredient
			(b) (4)
Mannitol			(b) (4)
Microcrystalline cellulose			
Croscarmellose Sodium			
Magnesium Stearate			
			(b) (4)
Other Ingredient – Film-Coating			

2. In vitro dissolution method and acceptance criteria:

The in vitro dissolution method proposed for this NDA is shown below in Table 2:

Table 2: In vitro dissolution method for baricitinib tablets (from M.3.2.P.5)

USP II (Paddles)	Apparatus
75 rpm	Rotation Speed
900 mL	Media Volume
pH 4.5 Acetate Buffer	Media
HPLC with UV Detection at 220 nm	Sample Analysis

The proposed dissolution acceptance criterion is as follows.

Not less than (b) (4) % (Q) in 30 minutes.

Table 3 shows the representative batches of baricitinib drug product that were evaluated for the dissolution specification proposal.

Table 3: Batches of baricitinib drug product that were evaluated for the dissolution specification proposal

Table 4: Solubility profile of phosphate and salt form of baricitinib

1 Page has been Withheld in Full as b4 (CCI/TS) immediately following this page

D. Discriminating ability of the *in vitro* dissolution method for baricitinib

The Applicant has evaluated the discriminating capability of the dissolution method with intentional variations in drug substance particle size, manufacturing parameters, and stress stability conditions as shown in the figures and tables below. The Applicant has also carried out dissolution of batches used in in vivo studies.

The dissolution method is sensitive to differences in drug substance particle size and changes in performance due to moisture exposure during storage at accelerated conditions. No significant change in dissolution is observed due to process changes such as (b) (4), or tablet coating. No improvement in discrimination was found by changing the dissolution medium pH within the physiological pH range. Significant changes in drug substance form (phosphate salt to free base) and formulation (capsule to tablet) did not result in a change in in vivo exposure.

Drug Substance Properties-Particle size variation

4. Dissolution Profile Data Comparisons:

Bridging of Formulations

The Applicant conducted two relative bioavailability studies during the course of baricitinib clinical development which bridge the formulations used in early clinical development to the commercial tablet. The capsule formulation containing the phosphate salt of baricitinib and the Phase 2 tablet formulation containing baricitinib free base were bridged in a relative bioavailability study (Study JADH). This study also investigated the effect of 2 different particle size of baricitinib (free base) on bioavailability and showed that PK parameters were similar for these particle sizes. The Applicant also conducted a relative bioavailability study (Study JAGO) to bridge the Phase 2 tablets and commercial tablets. The in vitro dissolution profiles were also compared between Phase 2 and commercial tablets. The bioavailability and dissolution profiles are similar for Phase 2 tablets and commercial tablets. The commercial tablets were used in the Phase 3 clinical trials.

Figure 14. Dissolution profiles for Clinical Study JAGO Phase 2 Tablet formulation and proposed Commercial Tablets (coated)

Figure 15. Dissolution profiles for Clinical Study JAGO Phase 2 Tablet formulation and proposed Commercial Tablets (coated)

5. Analytical Method and Its Validation:

In vitro dissolution analytical method validation report for Baricitinib IR tablets (Validation code B13225) was submitted in M.3.2.P.5.3, which were validated in terms of specificity, linearity, precision, accuracy, solution stability, and robustness, and is summarized below in Table 5.

Table 5: Summary of Method Validation for Dissolution of Baricitinib tablets (from M.3.2.P.5.3)

CHARACTERISTIC	EXPERIMENT	RESULT	ACCEPTANCE CRITERIA	CONCLUSION
Specificity	• The following samples were analyzed (n=1 each) • Media • Placebos (0.5-mg, 4-mg, 12-mg) in medium • 900 mL of medium was placed into each of four dissolution vessels equipped with paddles (apparatus II). • Each placebo was added to a separate vessel. One vessel contained only media. Heat was applied to the vessels to 37 °C and stirred at 150 rpm for 30 minutes. • The following clarification techniques were applied on each vessel (medium and placebo, n=1) • Pall Acrodisc 0.45µm nylon p/n 4502 • Centrifuge (at a minimum 5 minutes at min 4000rpm or until clarified) • Also analyzed (n=1) baricitinib reference standard in medium at a concentration of approximately equivalent to the lowest strength • Compared the chromatography to evaluate any interference from medium, filter, and excipients in media. • Quantitated any interference against the response of the lowest standard.	• No interfering peaks were observed in the components of the media, placebo or extractables. • See Figure 1 for example chromatograms.	• No significant interference with the LY3009104 peak from components of the media, placebo or extractables. • If peaks are observed, the total response (as calculated by the method) contributes not more than 2% error vs. the response of the reference standard in media.	Specificity is acceptable.

CHARACTERISTIC	EXPERIMENT	RESULT	ACCEPTANCE CRITERIA	CONCLUSION																										
Linearity	- Evaluated linearity using six solutions of baricitinib at concentrations ranging from 40% of the lowest strength (0.5mg/tablet); 40%, 70%, 100% and 130% of the 4.0 mg/tablet; and 120% of the highest strength (12 mg/tablet). - Compared the peak response versus the theoretical concentration of each standard solution (mg/mL) - Calculated the correlation coefficient (r), y-intercept, 95% confidence interval of the y-intercept and slope. - Calculated the residuals of the theoretical concentrations from the linear curve and evaluate the results for any trending. - Calculated the residual sum of squares.	Linearity Results: <table><tr><th>Parameter</th><th>Result</th></tr><tr><td>r value</td><td>1.000</td></tr><tr><td>y-intercept (Area Units)</td><td>461</td></tr><tr><td>Slope (AU*μL/mg)</td><td>55828576</td></tr><tr><td>y-Intercept p-value</td><td>0.6850</td></tr><tr><td>Residual sum of squares</td><td>13946746.8</td></tr></table> <table><tr><th>Concentration</th><th>Residuals (%)</th></tr><tr><td>40% of the 0.5 mg/tablet</td><td>-0.5</td></tr><tr><td>40% of the 4 mg/tablet</td><td>-0.5</td></tr><tr><td>70% of the 4 mg/tablet</td><td>0.4</td></tr><tr><td>100% of the 4 mg/tablet</td><td>-0.1</td></tr><tr><td>130% of the 4 mg/tablet</td><td>1.1</td></tr><tr><td>120% of the 12 mg/tablet</td><td>-0.4</td></tr></table> See Figure 2. Correlation coefficient (r) must be NLT 0.997. The y-intercept is either a) not statistically significantly different from zero (p-value must be ≥ 0.0500), or b) $\leq 4.0\%$ of the response corresponding to 100% of the 4-mg/tablet strength All residuals are $\leq 5\%$ of the response for the nominal strength (nearest to 100%) standard.	The correlation coefficient meets the acceptance criterion. The y-intercept is not statistically different from zero. The p-value was greater than 0.05 and is not statistically significant. Linearity is acceptable over a range of 0.0002 – 0.0180 mg/mL (See Figure 2 for results.)

CHARACTERISTIC	EXPERIMENT	RESULT	ACCEPTANCE CRITERIA	CONCLUSION																																																																																																																																
Accuracy (including filter recovery)	- Evaluated accuracy by preparing one solution of baricitinib at each of three concentration levels: 40% of the 0.5-mg strength spiked into 0.5-mg placebo (85F), 100% of 4 mg strength spiked into 4-mg (85G) placebo and 120% of the 12-mg strength spiked into 12-mg placebo (85G). Add 900mL of solution to each dissolution vessel, allowed solutions to equilibrate to 37°C, add placebo (85F or 85G) and mix at 150 rpm to generate a homogeneous sample. - After 30 min, acquire triplicate samples for each concentration level and sampling technique described in the method. - Sample each vessel (n=3) and use the following filter/techniques: - Manual sampling - Pall Acrodise 0.45µm Nylon p/n 4502 - Centrifugation (at a minimum 5 minutes at min 4000rpm or until clarified) - Analyzed each of the 18 solutions per the method. - Remove a portion of the highest and lowest level solutions (n=3) clarified using both techniques and store at room temperature and under refrigerated conditions (5°C) in HPLC vials for solution stability. - Calculated % of theory for average, SD, and RSD. - Calculated the 95% confidence intervals (upper and lower) on the standard error.	<table><tr><th rowspan="2">Level</th><th rowspan="2">Parameter</th><th colspan="2">Recovery (%)</th></tr><tr><th>Filtration</th><th>Centrifugation</th></tr><tr><td colspan="4">(b) (4)</td></tr><tr><td rowspan="6">40% of 0.5 mg</td><td>Mean (n=3)</td><td>99.5</td><td>101.5</td></tr><tr><td>Std Dev</td><td>1.2</td><td>0.4</td></tr><tr><td>%RSD</td><td>1.2</td><td>0.4</td></tr><tr><td>Lower 95% SD</td><td>0.6</td><td>0.2</td></tr><tr><td>Upper 95% SD</td><td>7.3</td><td>2.8</td></tr><tr><td>Filter Bias</td><td>98.0</td><td></td></tr><tr><td rowspan="6">100% of 4 mg</td><td>Mean (n=3)</td><td>99.1</td><td>101.0</td></tr><tr><td>Std Dev</td><td>1.4</td><td>0.2</td></tr><tr><td>%RSD</td><td>1.4</td><td>0.2</td></tr><tr><td>Lower 95% SD</td><td>0.7</td><td>0.1</td></tr><tr><td>Upper 95% SD</td><td>8.9</td><td>1.4</td></tr><tr><td>Filter Bias</td><td>98.1</td><td></td></tr><tr><td rowspan="6">120% of 12 mg</td><td>Mean (n=3)</td><td>98.8</td><td>100.7</td></tr><tr><td>Std Dev</td><td>0.5</td><td>0.7</td></tr><tr><td>%RSD</td><td>0.5</td><td>0.7</td></tr><tr><td>Lower 95% SD</td><td>0.3</td><td>0.3</td></tr><tr><td>Upper 95% SD</td><td>3.1</td><td>4.2</td></tr><tr><td>Filter Bias</td><td>98.1</td><td></td></tr><tr><td colspan="4">Lilly</td></tr><tr><td rowspan="6">40% of 0.5 mg</td><td>Mean (n=3)</td><td>99.1</td><td>99.1</td></tr><tr><td>Std Dev</td><td>0.7</td><td>0.3</td></tr><tr><td>%RSD</td><td>0.7</td><td>0.3</td></tr><tr><td>Lower 95% SD</td><td>0.4</td><td>0.2</td></tr><tr><td>Upper 95% SD</td><td>4.6</td><td>2.1</td></tr><tr><td>Filter Bias</td><td>100.0</td><td></td></tr><tr><td rowspan="6">100% of 4 mg</td><td>Mean (n=3)</td><td>100.2</td><td>100.0</td></tr><tr><td>Std Dev</td><td>0.3</td><td>0.1</td></tr><tr><td>%RSD</td><td>0.2</td><td>0.1</td></tr><tr><td>Lower 95% SD</td><td>0.1</td><td>0.0</td></tr><tr><td>Upper 95% SD</td><td>1.6</td><td>0.4</td></tr><tr><td>Filter Bias</td><td>100.2</td><td></td></tr><tr><td rowspan="6">120% of 12 mg</td><td>Mean (n=3)</td><td>99.0</td><td>99.2</td></tr><tr><td>Std Dev</td><td>0.2</td><td>0.1</td></tr><tr><td>%RSD</td><td>0.2</td><td>0.1</td></tr><tr><td>Lower 95% SD</td><td>0.1</td><td>0.0</td></tr><tr><td>Upper 95% SD</td><td>1.0</td><td>0.4</td></tr><tr><td>Filter Bias</td><td>99.8</td><td></td></tr></table>	Level	Parameter	Recovery (%)		Filtration	Centrifugation	(b) (4)				40% of 0.5 mg	Mean (n=3)	99.5	101.5	Std Dev	1.2	0.4	%RSD	1.2	0.4	Lower 95% SD	0.6	0.2	Upper 95% SD	7.3	2.8	Filter Bias	98.0		100% of 4 mg	Mean (n=3)	99.1	101.0	Std Dev	1.4	0.2	%RSD	1.4	0.2	Lower 95% SD	0.7	0.1	Upper 95% SD	8.9	1.4	Filter Bias	98.1		120% of 12 mg	Mean (n=3)	98.8	100.7	Std Dev	0.5	0.7	%RSD	0.5	0.7	Lower 95% SD	0.3	0.3	Upper 95% SD	3.1	4.2	Filter Bias	98.1		Lilly				40% of 0.5 mg	Mean (n=3)	99.1	99.1	Std Dev	0.7	0.3	%RSD	0.7	0.3	Lower 95% SD	0.4	0.2	Upper 95% SD	4.6	2.1	Filter Bias	100.0		100% of 4 mg	Mean (n=3)	100.2	100.0	Std Dev	0.3	0.1	%RSD	0.2	0.1	Lower 95% SD	0.1	0.0	Upper 95% SD	1.6	0.4	Filter Bias	100.2		120% of 12 mg	Mean (n=3)	99.0	99.2	Std Dev	0.2	0.1	%RSD	0.2	0.1	Lower 95% SD	0.1	0.0	Upper 95% SD	1.0	0.4	Filter Bias	99.8		- The average recovery (n=3) of baricitinib from placebo at each level (sample/filter/technique combination) must be within 98.0% to 102.0% of the theoretical response when analyzed against the 40% (0.5 mg tablet strength), 100% of 4 mg strength and 120% of the 12-mg strength lacking the placebo matrix. - Report the filter bias at each concentration level as the average recovery at each level relative to the centrifuged samples is 98.0-102.0%	The accuracy results meet the criterion for recovery and filter bias, measured by relative recovery. Therefore, the method is accurate and suitable for the intended use.

CHARACTERISTIC	EXPERIMENT	RESULT	ACCEPTANCE CRITERIA	CONCLUSION																																																															
Precision (Intermediate Precision, Repeatability)	0.5, 1, 4, and 12- mg tablets were tested by two analysts. (b) (4) executed the precision test on the 0.5-mg and 4-mg preparations and Lilly executed the precision test on the 1-mg and 12-mg preparations. - Repeatability: Determined the within run standard deviation of each of four runs (n=6 vessels) at 15 and 45 min for each strength; and then calculated the pooled within run SD for each timepoint by strength (n=24). - Intermediate Precision: For each tablet strength, determined the run averages (n=4) at both 15 and 45 min, and the SD of the 4 run averages. - Calculated the 90% confidence intervals for the mean for each timepoint (15 and 45 min) for each strength (upper and lower)	<table><thead><tr><th>Dose, Time Point</th><th>Method Repeatability SD (%)</th><th>Intermediate Precision SD (%)</th></tr></thead><tbody><tr><td>0.5-mg, 15 min</td><td>2.52</td><td>2.40</td></tr><tr><td>0.5-mg, 45 min</td><td>1.80</td><td>2.36</td></tr><tr><td>1-mg, 15 min</td><td>1.30</td><td>0.94</td></tr><tr><td>1-mg, 45 min</td><td>1.68</td><td>1.00</td></tr><tr><td>4-mg, 15 min</td><td>1.59</td><td>0.66</td></tr><tr><td>4-mg, 45 min</td><td>1.22</td><td>0.62</td></tr><tr><td>12-mg, 15 min</td><td>0.92</td><td>1.00</td></tr><tr><td>12-mg, 45 min</td><td>1.37</td><td>1.12</td></tr></tbody></table> <table><thead><tr><th>Dose, Time Point</th><th>Mean (n=4)</th><th>90% Lower CI</th><th>90% Upper CI</th></tr></thead><tbody><tr><td>0.5-mg, 15 min</td><td>98.64</td><td>95.81</td><td>101.46</td></tr><tr><td>0.5-mg, 45 min</td><td>101.57</td><td>98.79</td><td>104.35</td></tr><tr><td>1-mg, 15 min</td><td>91.83</td><td>90.73</td><td>92.93</td></tr><tr><td>1-mg, 45 min</td><td>98.97</td><td>97.79</td><td>100.14</td></tr><tr><td>4-mg, 15 min</td><td>87.48</td><td>86.70</td><td>88.26</td></tr><tr><td>4-mg, 45 min</td><td>96.13</td><td>95.63</td><td>96.63</td></tr><tr><td>12-mg, 15 min</td><td>84.81</td><td>83.64</td><td>85.99</td></tr><tr><td>12-mg, 45 min</td><td>96.89</td><td>95.57</td><td>98.20</td></tr></tbody></table>	Dose, Time Point	Method Repeatability SD (%)	Intermediate Precision SD (%)	0.5-mg, 15 min	2.52	2.40	0.5-mg, 45 min	1.80	2.36	1-mg, 15 min	1.30	0.94	1-mg, 45 min	1.68	1.00	4-mg, 15 min	1.59	0.66	4-mg, 45 min	1.22	0.62	12-mg, 15 min	0.92	1.00	12-mg, 45 min	1.37	1.12	Dose, Time Point	Mean (n=4)	90% Lower CI	90% Upper CI	0.5-mg, 15 min	98.64	95.81	101.46	0.5-mg, 45 min	101.57	98.79	104.35	1-mg, 15 min	91.83	90.73	92.93	1-mg, 45 min	98.97	97.79	100.14	4-mg, 15 min	87.48	86.70	88.26	4-mg, 45 min	96.13	95.63	96.63	12-mg, 15 min	84.81	83.64	85.99	12-mg, 45 min	96.89	95.57	98.20	- Repeatability: For each strength at 15 and 45 minutes the pooled within run SD must be $\leq 3.5\%$ - Intermediate Precision: for each strength at 15 and 45 min, the standard deviation (n=4) of the run averages for each timepoint must be $\leq 4.0\%$	Both repeatability and intermediate precision met the acceptance criteria. Therefore, the precision is acceptable for its intended use.

CHARACTERISTIC	EXPERIMENT	RESULT	ACCEPTANCE CRITERIA	CONCLUSION																																																				
Robustness (Chromatographic conditions and dissolution settings)	Twelve factors were investigated in a sixteen-run split-plot study augmented with four center points.	The robustness of the chromatographic conditions and dissolution settings was evaluated using a sixteen-run split-plot study augmented with four center points. Twelve factors were examined to determine the effects of small changes in the method parameters on the dissolution (% released at 15 and 30 minutes) and system suitability results. The following factors and ranges were evaluated. <table><thead><tr><th>Factor</th><th>Low Level</th><th>Mid Level</th><th>High Level</th></tr></thead><tbody><tr><td>Paddle Speed (rpm)</td><td>72</td><td>75</td><td>78</td></tr><tr><td>Bath Temperature (°C)</td><td>35</td><td>37</td><td>39</td></tr><tr><td>Paddle Height (mm)</td><td>23</td><td>25</td><td>27</td></tr><tr><td>Dose (mg)</td><td>1</td><td>-</td><td>12</td></tr><tr><td>De-aeration of media</td><td>No</td><td>-</td><td>Yes</td></tr><tr><td>Buffer salt amount in media (g) per 6 L</td><td>16.11</td><td>17.9</td><td>19.69</td></tr><tr><td>Column Age</td><td>Old</td><td>-</td><td>New</td></tr><tr><td>Mobile phase % Organic</td><td>18</td><td>20</td><td>22</td></tr><tr><td>Flow rate (mL/min)</td><td>2.7</td><td>3</td><td>3.3</td></tr><tr><td>Injection volume (µL)</td><td>45</td><td>50</td><td>55</td></tr><tr><td>Column Temperature (°C)</td><td>36</td><td>40</td><td>44</td></tr><tr><td>Detector Wavelength (nm)</td><td>218</td><td>220</td><td>222</td></tr></tbody></table> While a number of statistically significant effects were observed, the absolute magnitude of those effects were small and not of practical significance. Furthermore, all of the individual experimental results are well within acceptable ranges that meet system suitability criteria indicated in the method. There was no appreciable impact to the dissolution release or HPLC system performance attributable to the dissolution or HPLC parameters examined in this study. The tablet dosage was found to have an effect on the % released at the 15 minute and 30 minute time points; however, the effect is not method related and is a function of the drug product formulation. Reviewer's Assessment:

{Assess method development, method robustness, and criteria; modeling approach}

- The Applicant's dissolution method development report and the proposed dissolution method is acceptable.
- Applicant's proposed dissolution acceptance criteria is, *Not less than* (b) (4) % (Q) in 30 minutes. The proposed dissolution acceptance criterion is acceptable.
- The Applicant reported that the dissolution method was able to discriminate differences in drug substance particle size and changes in performance due to moisture exposure during storage at accelerated conditions.
- The comparative dissolution profile data for the clinical study JAGO Phase 2 Tablet formulation and proposed Commercial Tablets are reviewed and considered acceptable. Both Phase 2 Tablets and proposed Commercial Tablets release more than (b) (4) % of drug at 15 minutes and have similar dissolution profiles. No f2 values were calculated as the product is rapidly dissolving.
- The analytical method validation report for baricitinib are reviewed and considered acceptable. The linearity was demonstrated with concentrations ranging from 40% of a

0.5 mg dose to 120% of a 12 mg dose (0.0002 – 0.0180 mg/mL) of baricitinib. There were some concentrations lower than 40% at 5 minutes sampling point for 4 mg phase 2b capsule (see figure 12, batch#CT567281 used in JADH study) which were not covered in this range. However, this is acceptable because the commercial baricitinib tablets have concentrations above 40% at 5 minute time point (figures 13-15).

- A dose proportionality study was conducted which showed that the PK of baricitinib are dose proportional up to 30 mg. Section 2.7.2.3.1.8 contains a complete description of the dose proportionality assessments for baricitinib.

List of Deficiencies:

From the Biopharmaceutics perspective, this NDA is recommended for approval.

Primary Biopharmaceutics Reviewer Name and Date: Kalpana Paudel, 05/24/2016

Attachment I – Final Risk Assessment – NDA 207924

DP attribute/ CQA	Factors that can impact the CQA	O ¹	S ^{1, 2}	D ¹	FMECA RPN #	Comment & considerations
Description	(b) (4)	1	3	3	9	(b) (4)
Identification	- incorrect drugs formulated - no drug formulated - incorrect crystalline form of API	1	3	2	6	
Potency(assay) /Purity	- input purity of APIs - input purity of excipients - incorrect amounts of API formulated - impurity formation due to interaction of drugs with excipients or catalyzed by excipients - degradation of drug substances due to moisture and oxidation (protection from environment) - presence of (b) (4) (b) (4)	1	3	2	6	

¹ O = Probability of Occurrence; S = Severity of Effect; D = Detectability

² Severity of effect can only be estimated; input from clinical, clinical pharmacology, and pharmacology/toxicology team would be necessary for more accurate assessment of clinical impact of failures of product CQAs.

Attachment I – Final Risk Assessment – NDA 207924

		(b) (4)					(b) (4)
Release (dissolution)	• (b) (4) • changes in input excipients and APIs • API particle size change • (b) (4) particle size • (b) (4) • tablet hardness	2	3	3	18		

Attachment I – Final Risk Assessment – NDA 207924

Content uniformity	• (b) (4) • particle size of API	2	3	3	18	(b) (4)
Microbial limits ³	• microbial load of input materials for formulation • microbial contamination during processing (e.g., during tablet coating) • microbial growth during shelf life	1	3	3	9

Subject: Method Verification for NDA-207924: Olumiant Baricitinib Tablets 2mg, 4 mg

The following methods were verified and are acceptable for quality control and regulatory purposes:

- Analytical Procedure – Assay and Uniformity of Dosage Units (HPLC – Potency – Method Code B13320)
- Analytical Procedure – Purity (HPLC – Potency – Method Code B13319)
- Analytical Procedure – Assay (HPLC – Method Code G1749) for Drug Substance
- Analytical Procedure – Impurities (HPLC – Method Code G1750) for Drug Substance
