Executive Summary:

1. Recommendations:

A. Recommendation and Conclusion on Approvability:

The Office of Biotechnology Products, OPQ, CDER, recommends approval of STN 761216 for YUSIMRY manufactured by Coherus Biosciences. The data submitted in this application are adequate to support the conclusion that the manufacture of YUSIMRY is well-controlled and leads to a product that is pure and potent. It is recommended that this product be approved for human use under conditions specified in the package insert.

- B. Approval Action Letter Language:
 - Manufacturing location:
 - o Drug Substance:

o Drug Product:

- Fill size and dosage form:
 - o Prefilled Syringes (PFS): 40 mg/0.8 mL
- Dating period:
 - o Drug Product: Either 36 months at 5 ± 3°C or the age of the drug substance batch subtracted from 48 months, whichever is shorter. This dating period may include a single period up to 14 days at a maximum of 25°C with protection from light. The start date of the dating period is the date of manufacture defined as the date of final sterile filtration of the formulated drug product.
 - o Drug Substance: (b) (4) months at C C C C
- Exempt from lot release:
 - Yes, YUSIMRY is a specified product and exempt from lot release. Per FR notice
 95-29960 well-characterized therapeutic recombinant DNA-derived and

monoclonal antibody biotechnology products are exempted from 21 CFR 601.2a lot release requirements.

Coherus states that because this BLA is submitted under the 351(k) pathway, it is exempt from the 21 CFR 25.20 requirement to provide an environmental assessment. They request a categorical exclusion under 21 CFR Part 25.31(g): "Establishment of bioequivalence requirements for a human drug or a comparability determination for a biologic product subject to licensing".

The grounds for this request are acceptable; the exclusion may be granted.

C. Assessment Summary:

YUSIMRY (adalimumab-aqvh, CHS-1420) is a proposed biosimilar to US-Humira Pfizer seeking licensure for the following indications: Rheumatoid Arthritis (RA), Psoriatic Arthritis (PsA), Ankylosing Spondylitis (AS), Crohn's Disease (CD) in patients 6 years of age and older, Ulcerative Colitis (UC), Plaque Psoriasis (Ps), Juvenile idiopathic arthritis (JIA) in patients 2 years of age and older, for which US-Humira is licensed.

The data submitted support the demonstration that YUSIMRY is highly similar to US-Humira, notwithstanding minor differences in clinically inactive components (refer to Section II of this memo for further details and discussion of the differences observed).

The assessment of manufacturing information provided in this application has concluded that the methodologies and processes used for drug substance (DS) and drug product (DP) manufacturing, release, and stability testing are sufficiently robust and controlled to ensure the consistent manufacture of a safe, pure, and potent product.

The microbial control and sterility assurance strategy is sufficient to support consistent manufacture of a sterile product and the OPMA assessors are recommending approval for this BLA from a sterility assurance and microbiology product quality perspective.

The OPMA facilities assessment supports their recommendation of approval for this BLA.

Individual assessments for each discipline are located in separate documents in Panorama.

II. Comparative Assessment and Evaluation of the Analytical Component of the Scientific Bridge

A. Analytical Assessment Overview and Conclusions

To support a demonstration that CHS-1420 is highly similar to US-licensed Humira (hereafter referred to as US-Humira), Coherus Biosciences performed a comparative analytical assessment using 43 lots of US-Humira (40 mg/0.8 mL) with expiration dates ranging from April 2015 through June 2021 and 16 independent lots of CHS-1420 DP in addition to a single independent lot of DS (all at 40 mg/0.8 mL) with expiration dates ranging from May 2018 to October 2022. The ages at the time of testing span the shelf-life of US-Humira and were adequate to capture potential reference product differences over time for the 40 mg/0.8 mL strength.

There were three process iterations during the commercial development stage of CHS-1420: the late-development (used in comparative clinical studies), pre-commercial, and commercial manufacturing processes. These process iterations had the goal of enhancing process consistency and further improvement of the analytical similarity between CHS-1420 and US-Humira. All late development lots used in comparative clinical studies were included in the comparative analytical assessment. The CHS-1420 lots used in the comparative analytical assessment all represent independent DS lots; their derivation is as follows:

• 6 lots of late-development CHS-1420 DP manufactured at commercial scale

(b) (4

- 5 lots of pre-commercial CHS-1420 DP manufactured at commercial scale
- 5 lots of commercial CHS-1420 DP manufactured at commercial scale
- 1 lot of commercial CHS-1420 DS manufactured at commercial scale

The comparability of the lots manufactured by late-development and pre-commercial processes to CHS-1420 manufactured by the commercial manufacturing process was discussed in a BPD Type 2 meeting held with the Agency on August 1, 2019 and was assessed and found to be established for both previous processes based on data submitted to this BLA. While the small improvements that were made in the pre-commercial and commercial manufacturing processes to

with US-Humira strengthened the data to support a demonstration that CHS-1420 is highly similar to US-Humira, these changes would not preclude the ability to leverage the clinical studies that were performed with late-development lots of CHS-1420 as they were found to be comparable with lots manufactured by the proposed commercial process.

The comparative analytical assessment was comprised of extensive comparative physicochemical and functional assessment of the quality attributes of CHS-1420 and US-Humira and included a comparative assessment of their degradation profiles under several relevant forced degradation conditions including thermal stress (40°C for 3 months), oxidative stress (~0.01% H2O2 at 37°C for 3 hours), base stress (pH 8.0 at 37°C for 10 days), acidic stress (pH 2.2 at 37°C for 2 hours), and photo (light) stress (200 W/m2 UV-A light-hr + 1200 klux-hr visible light).

Coherus assessed quality attributes using an approach based on risk and criticality for statistical evaluation of analytical results. The highest-ranking attributes that were tested using quantitative assays were evaluated using equivalence testing. Attributes that were considered moderate for criticality that were tested using quantitative assays were evaluated using quality ranges that took both manufacturing variability of US-Humira as well as assay variability into account; these ranges were established by multiplying the standard deviation of the US-Humira data by a multiplier of 3. The standard deviation multiplier used to establish each quality range was scientifically justified. The least critical attributes, and those attributes that were tested using qualitative assays, were evaluated using a comparison of visual displays of the data. Results from method validation or qualification studies support the suitability of the methods used in the comparative analytical assessment.

Coherus is seeking licensure of 40 mg/0.8 mL CHS-1420 in a single-dose prefilled syringe. Our assessment of the CHS-1420 and US-Humira data supports that CHS-1420 has been

demonstrated to be highly similar to US-Humira, notwithstanding minor differences in clinically inactive components. CHS-1420 has the same strength, dosage form, and route of administration as US-Humira. Coherus used a comprehensive selection of analytical methods that were suitable to evaluate the critical quality attributes of CHS-1420 and US-Humira to support the demonstration that the products are highly similar. Numbers of lots tested and statistical analyses were appropriate to allow for a meaningful evaluation of the results of the comparative analytical studies. While some differences were observed in a subset of quality attributes, these differences were determined not to preclude a demonstration that CHS-1420 and US-Humira are highly similar.

| Attributes | Deliverable volume | Yes |

Soluble TNF α (sTNF Soluble TNF α (sTNF α) binding and neutralization of sTNF α -induced cytotoxicity are generally regarded as the primary mechanisms of action for adalimumab. Three assays were conducted to address these activities and the results were analyzed by equivalence testing (ELISA for sTNF α and inhibition of apoptosis) and by establishing a quality range (SPR for sTNF α). For both the cytotoxicity neutralization assay and the sTNF- α binding assay by ELISA, Coherus provided data from 16 lots of CHS-1420 and 26 lots of US-Humira. OBP reviewed the justification of lots selected and concluded that the lot selection for each product adequately captured the lot-to-lot variability. The data met the equivalence margins for the binding ELISA data for sTNF α and inhibition of apoptosis, and CHS-1420 data fell within the US-Humira Quality Range supporting a demonstration that CHS-1420 is highly similar to US- Humira.

Additional potential mechanisms of action have been described for adalimumab, including antibody dependent cell-mediated cytotoxicity against cells expressing transmembrane TNF- α (tmTNF- α), complement dependent cytotoxicity against tmTNF- α positive cells, "reverse signaling" (signal transduction into cells by activation of tmTNF- α), and induction of regulatory

macrophages. Evidence suggests that the Fc-dependent induction of regulatory macrophages is important in Crohn's Disease and Ulcerative Colitis. Assays that are orthogonal to the sTNF α binding and the neutralization assays, assays that evaluate these additional potential mechanisms of action, and assays that evaluate purity, protein content, and other general properties of adalimumab were assigned for quality range or visual comparison assessment.

The biochemical and biological activity attributes tested in Table A met the pre-defined comparative analytical acceptance criteria in the comparison of CHS-1420 to US-Humira with exceptions discussed in Section D of this memo. The results of comparative stability studies under stressed and accelerated conditions indicate that the degradation pathways and the rate of degradation of CHS-1420 DP and US-Humira are similar and the differences noted do not preclude a demonstration that CHS-1420 is highly similar to US-Humira.

C. Comparative Analytical Studies to Support the Use of a Non-US-Licensed Comparator Product

Not applicable.

D. Assessment of Analytical Study Results

Comparative analytical acceptance criteria were met for all attributes evaluated with quality ranges with the following exceptions:

- Sialic acid: Sialylated glycans in 4 of 17 CHS-1420 lots (0.1-0.2%) are below the QR of US-Humira (0.2-1.0%). These lots were all manufactured by the late-development process, whereas sialic acid levels for all pre-commercial and commercial lots of CHS-1420 fell within the QR. Sialyation of the conserved Fc glycan may have the potential to impact Fc functions or PK but no correlation to suggest such an impact was found in the biological function and FcR-binding assays, likely due to the fact that there are very low amounts of this modification in either CHS-1420 or US-Humira. Therefore, the differences noted in sialic acid content do not preclude a demonstration that CHS-1420 is highly similar to US-Humira.
- Terminal Galactose: Similar to sialic acid, the levels of terminal galactosylation (tGal) of the N-linked glycan of CHS-1420 were lower than those of US-Humira in 5 of 17 lots with a 6th lot at the lower limit of the QR (4.7 15.3%), although all of these lots were manufactured by the late-development process. tGal levels of pre-commercial and commercial lots of CHS-1420 are within the QR for US-Humira (15.3-19.9%). While lower galactosylation can decrease Fc binding to C1q and result in lower CDC activity, no differences were observed for either C1q binding or CDC activity between CHS-1420 and US-Humira. In addition, terminal galactosylation is adequately controlled in CHS-1420 DS release. Therefore, the differences noted in terminal galactose levels do not preclude a demonstration that CHS-1420 is highly similar to US-Humira.
- FcγRIIIa (158V) binding: 2 of 16 lots of CHS-1420 tested showed percent relative binding affinities to the high-affinity variant of FcγRIIIa (158V) that were slightly below the QR for US-Humira (93.7% (CHS-1420 late-development lot) and 95.0% (CHS-1420 commercial lot) compared with US-Humira (QR of 96.7-122.3%), although similar results were not found for the low-affinity variant of FcγRIIIa (158F), FcγRIIIb, or ADCC. Generally, the low-affinity

variant is more sensitive to differences in binding affinity, and these small differences in relative binding affinity by K_D would not be considered impactful and may have been due to experimental variability. Regardless, in consideration of all of the comparative data that support potential Fc γ RIII-dependent mechanisms of action, as well as the fact that levels of fucosylated glycans and ADCC are adequately controlled in CHS-1420 DS release, the differences noted in Fc γ RIIIa (158V) binding do not preclude a demonstration that CHS-1420 is highly similar to US-Humira.

- Size Variants (% Main Peak by non-reduced CE-SDS (nrCE-SDS)): 9 of 16 lots of CHS-1420 demonstrated purity by non-reducing CE-SDS that was lower than the QR for US-Humira. However, these differences were attributed to earlier manufacturing processes for CHS-1420; all CHS-1420 DS lots manufactured by the current commercial process demonstrated purity between 97.2-97.7% (QR ≥ 96.3%). Differences were attributable to increased levels of partially reduced species such as light chain and heavy-heavy-light fragments. The cause of these partially reduced species in CHS-1420 is unknown but such fragments can be caused by cellular lysis during harvest steps or poor cell growth conditions. Furthermore, lots with lower purity by nrCE-SDS demonstrate no meaningful differences in terms of potency and Fab- or Fc-dependent binding, as non-covalent interactions are known to maintain antibody integrity as evidenced by the lack of difference observed between CHS-1420 and US-Humira by SE-UPLC. Overall, the difference observed in purity by nrCE-SDS reflects earlier iterations of the manufacturing process and does not preclude a demonstration that CHS-1420 is highly similar to US-Humira. Furthermore, CHS-1420 DS and DP purity by nrCE-SDS is adequately controlled at release and on stability.
- Protein Concentration: While 2 out of 16 lots of CHS-1420 were higher than the QR for protein concentration of US-Humira (51.6 and 51.9%, compared to a QR of 45.3-50.3%), these lots were late development lots and subsequent process modifications have ensured that all lots of pre-commercial and commercial CHS-1420, as well as all lots manufactured by the commercial process, are within an acceptable range. The differences observed in the protein concentration of the late development CHS-1420 lots does not preclude a demonstration that CHS-1430 is highly similar to US-Humira.

In summary, the totality of the comparative analytical assessment supports the following conclusion:

- CHS-1420 is highly similar to US-Humira, notwithstanding minor differences in clinically inactive components.
- For attributes where minor differences were observed between CHS-1420 and US-Humira, the totality of the analytical data supports that the function, activity, and in vitro stability of CHS-1420 and US-Humira are similar. Specifically, the differences noted in glycosylation, fragment levels, and FcγRIIIa (158V) binding were not found in the CHS-1420 commercial lots and further, were not reflected in cell-based functional assays such as cytotoxicity, neutralization, ADCC, and CDC assays. Therefore, the analytical differences observed do not preclude a demonstration that CHS-1420 is highly similar to US-Humira.

E. Same Strength

CHS-1420 has the same dosage form and route of administration as US-Humira. Coherus Biosciences is seeking approval of 40 mg/0.8 mL CHS-1420 in a single-dose prefilled syringe. US-Humira is available at this strength in this presentation. Coherus Biosciences is seeking approval of CHS-1420 for the same strength as US-Humira. Comparative protein concentration (mg/mL) was assessed as part of the comparative analytical assessment.

Were assessed as part of manufacturing process controls. Based on the similarity and manufacturing data, the 40 mg/0.8 mL CHS-1420 prefilled syringe has the same total content of drug substance in units of mass in a container and the same concentration of drug substance in units of mass per unit volume as the corresponding presentation of US-licensed Humira. The strength of 40mg/0.8mL CHS-1420 in the prefilled syringe is the same as that of US-Humira.

Description:

CHS-1420 is a recombinant human IgG1 kappa monoclonal antibody produced in CHO cells consisting of 2 heavy chains and 2 kappa light chains. Each heavy chain contains 451 amino acids and each light chain contains 214 amino acids. The antibody targets human TNF. The heavy chains contain typical N-linked glycans at a consensus glycosylation site on asparagine 301 that are predominantly core fucosylated, complex-type, bi-antennary structures, G0F/G0F (major species), and G0F/G1F, G1F/G1F, with small amounts of G2F. CHS-1420 has a molecular weight of approximately 148 kDa and has a typical IgG1 antibody structure of 16 disulfide bridges including 12 intrachain and 4 interchain.

Mechanism of Action (MoA):

CHS-1420 specifically binds to TNF- α and inhibits its function by blocking its interaction with TNFR-1 and TNFR-2. TNF- α , expressed by immune cells and other cells in response to infection or inflammation, is expressed both as a soluble cytokine (TNF α) and a membrane-bound (mTNF- α) form. CHS-1420 can also induce multiple Fc-dependent effector functions that depend on binding to m TNF α , including induction of regulatory macrophages, antibody mediated reverse signaling, ADCC and CDC. These activities have been suggested to contribute to inflammatory bowel disease indications, although the significance of the contribution of any of these individual mechanisms is not well established (based on literature review).

Potency Assay:

Coherus proposes to use three potency assays for CHS-1420. The first measures its ability to neutralize TNF α binding to cell surface TNF α receptors by assessing the CHS-1420 inhibition of TNF α induced apoptosis in U937 cells, a human monocyte cell line that expresses TNF α receptors.

The ADCC potency assay uses Chinese Hamster Ovary (CHO)-K1 cells that express a membrane-bound tumor necrosis factor alpha (mTNF α CHO-K1) and ADCC effector cells from an engineered Jurkat cell line. ADCC activity is measured as NFAT-driven luciferase activity resulting from binding of effector cells to CHS-1420.

C1q binding by ELISA is used as a surrogate for potential CHS-1420-dependent CDC activity.

| • | Reference Materials: The primary reference standard (PRS) 1420-DS-111-RS was generated from C material for release and stability testing of CHS-1420 DS and DP. It was prepared commercial-scale lot CHB1506CA manufactured by the | |

Dating period and storage conditions:

The dating period for the drug substance is (b) (4) months when stored at (b) (4) oC. (a) months of real time stability results were provided for clinical and precommercial stability lots manufactured by a process representative of the intended marketing process, as well as (b) (a) months of data for PPQ lots. Accelerated and stressed stability data also support that (b) (4) month expiration dating can be given to DS stored at (b) (4) oC based on the data available. The post-approval DS stability protocol proposes to place one lot of DS annually on stability.

C. Drug Product YUSIMRY Quality Summary:

Table 4 provides a summary of the identification, risk, and lifecycle knowledge management for drug product CQAs that derive from the drug product manufacturing process and general drug product attributes. For additional information, see the OBP quality technical assessment and the Drug Product Microbiology and Facilities technical assessment in Panorama.

Table 4: Drug Product CQA Identification, Risk, and Lifecycle Management

LABELS AND LABELING ASSESSMENT

| Date of Assessment: | 11/19/2021 |
|---------------------------------|--|
| Assessor: | Jim Barlow, RPh Labeling Assessor |
| | Office of Biotechnology Products (OBP) |
| Through: | Jennifer Swisher PhD, Product Quality Assessor |
| | OBP/Division of Biotechnology Review and Research LRT 2 |
| Application: | BLA 761216 |
| Applicant: | Coherus BioSciences, Inc. |
| Submission Date: | December 18, 2020; May 6, 2021; September 20, 2021 and November 18, 2021 |
| Product: | Yusimry (adalimumab-aqvh) |
| Dosage form(s): | Injection |
| Strength and Container-Closure: | 40 mg/0.8 mL in a prefilled single-dose syringe |
| Purpose of assessment: | The Applicant submitted a biologics license application for CHS-1420 (conditionally approved nonproprietary name: adalimumab-aqvh), has been developed as a proposed biosimilar to the reference product, Humira® (adalimumab), licensed in the United States under Section 351(a) of the Public Health Service Act (AbbVie, Inc., North Chicago, IL 60064 U.S.A). This Biologics License Application is submitted for the purpose of licensure under Section 351(k) of the Public Health Service Act. |
| Recommendations: | The prescribing information, medication guide, patient labeling, instructions for use, container labels, and carton labeling are acceptable from an OBP labeling perspective. |

| Materials Considered for this Label and Labeling Assessment | | | |
|---|------------------|--|--|
| Materials Assessed | Appendix Section | | |
| Proposed Labels and Labeling | A | | |
| Evaluation Tables | В | | |
| Acceptable Labels and Labeling | С | | |

n/a = not applicable for this assessment

DISCUSSION

We assessed the proposed labels and labeling for compliance with applicable requirements in the Code of Federal Regulations. Also, we assessed the proposed labels and labeling for consistency with recommended labeling practices. (see Appendix B)

CONCLUSION

The prescribing information, medication guide and instructions for use submitted on November 18. 2021 and the container labels and carton labeling submitted on 9/20/2021 were assessed and found to be acceptable from an OBP labeling perspective.

¹ Per 21 CFR 1.3(b) *Label* means any display of written, printed, or graphic matter on the immediate container of any article, or any such matter affixed to any consumer commodity or affixed to or appearing upon a package containing any consumer commodity.

² Per CFR 600.3(dd) *Label* means any written, printed, or graphic matter on the container or package or any such matter clearly visible through the immediate carton, receptacle, or wrapper.

³ Per 21 CFR 1.3(a) *Labeling* includes all written, printed, or graphic matter accompanying an article at any time while such article is in interstate commerce or held for sale after shipment or delivery in interstate commerce.

⁴ Per 21 CFR 600.3(bb) *Container* (referred to also as "final container") is the immediate unit, bottle, vial, ampule, tube, or other receptacle containing the product as distributed for sale, barter, or exchange.

⁶ Per 21 CFR 600.3(cc) *Package* means the immediate carton, receptacle, or wrapper, including all labeling matter therein and thereon, and the contents of the one or more enclosed containers. If no package, as defined in the preceding sentence, is used, the container shall be deemed to be the package. Thus, this includes the carton, prescribing information, and patient labeling.
