LABELING

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use OTEZLA/OTEZLA XR safely and effectively. See full prescribing information for OTEZLA/OTEZLA XR.

OTEZLA® (apremilast) tablets, for oral use

OTEZLA XR™ (apremilast) extended-release tablets, for oral use

Initial U.S. Approval: 2014

RECENT MAJOR CHANGES

Indications and Usage (1)	08/2025
Dosage and Administration (2)	08/2025

INDICATIONS AND USAGE

OTEZLA/OTEZLA XR, an inhibitor of phosphodiesterase 4 (PDE4), is indicated for the treatment of:

Adult patients with:

- Active psoriatic arthritis (1.1)
- Plaque psoriasis who are candidates for phototherapy or systemic therapy (1.2)
- Oral ulcers associated with Behçet's Disease (1.3)

Pediatric patients 6 years of age and older with:

- Active psoriatic arthritis (1.1)
- Moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy (1.2)

In the pediatric population, OTEZLA is indicated for patients weighing at least 20 kg, and OTEZLA XR is indicated for patients weighing at least 50 kg.

DOSAGE AND ADMINISTRATION

To reduce the risk of gastrointestinal symptoms, titrate to recommended dosage as follows:

- **Adults with Psoriatic Arthritis, Plaque Psoriasis, or Behçet's Disease**
 - See Table 1 for the initial titration schedule. Recommended maintenance dosage is OTEZLA 30 mg twice daily or OTEZLA XR 75 mg once daily (2.1)
- **Pediatric Patients 6 Years of Age and Older and Weighing at Least 20 kg with Psoriatic Arthritis or Moderate to Severe Plaque Psoriasis**
 - See Table 2 for the initial titration schedule (2.1)
 - For patients weighing 50 kg or more: Recommended maintenance dosage is OTEZLA 30 mg twice daily or OTEZLA XR 75 mg once daily (2.1)
 - For patients weighing 20 kg to less than 50 kg: Recommended maintenance dosage is OTEZLA 20 mg twice daily (2.1)
- **Dosage in Patients with Severe Renal Impairment:**
 - **Adult Patients:** For initial dosage titration, titrate using only morning schedule listed in Table 1 and skip afternoon doses. Recommended maintenance dosage is OTEZLA 30 mg once daily (2.3)
 - **Pediatric Patients 6 Years of Age and Older and Weighing at Least 20 kg with Psoriatic Arthritis or Moderate to Severe Plaque Psoriasis:** For initial dosage titration, titrate using only morning schedule for appropriate body weight category in Table 2 and skip afternoon doses (2.3)
 - For patients weighing 50 kg or more: Recommended maintenance dosage is OTEZLA 30 mg once daily (2.3)

- For patients weighing 20 kg to less than 50 kg: Recommended maintenance dosage is OTEZLA 20 mg once daily (2.3)

DOSAGE FORMS AND STRENGTHS

OTEZLA Tablets: 10 mg, 20 mg, 30 mg (3)

OTEZLA XR Tablets: 75 mg (3)

CONTRAINDICATIONS

Known hypersensitivity to apremilast or to any of the excipients in the formulation (4)

WARNINGS AND PRECAUTIONS

- **Hypersensitivity:** Cases of angioedema and anaphylaxis have been reported during post marketing surveillance. Avoid the use of OTEZLA/OTEZLA XR in patients with known hypersensitivity to apremilast or to any of the excipients in the formulation. If signs or symptoms of serious hypersensitivity reactions develop during treatment, discontinue OTEZLA/OTEZLA XR and institute appropriate therapy (5.1)
- **Diarrhea, Nausea, and Vomiting:** Consider OTEZLA/OTEZLA XR dosage reduction or suspension if patients develop severe diarrhea, nausea, or vomiting (5.2)
- **Depression:** Advise patients, their caregivers, and families to be alert for the emergence or worsening of depression, suicidal thoughts or other mood changes and if such changes occur to contact their healthcare provider. Carefully weigh risks and benefits of treatment with OTEZLA/OTEZLA XR in patients with a history of depression and/or suicidal thoughts or behavior (5.3)
- **Weight Decrease:** Monitor weight regularly. If unexplained or clinically significant weight loss occurs, evaluate weight loss and consider discontinuation of OTEZLA/OTEZLA XR (5.4)
- **Drug Interactions:** Use with strong cytochrome P450 enzyme inducers (e.g., rifampin, phenobarbital, carbamazepine, phenytoin) is not recommended because loss of efficacy may occur (5.5, 7.1)

ADVERSE REACTIONS

- **Psoriatic Arthritis:** The most common adverse reactions (≥ 5%) are diarrhea, nausea, and headache (6.1)
- **Plaque Psoriasis:** The most common adverse reactions (≥ 5%) are diarrhea, nausea, upper respiratory tract infection, and headache, including tension headache (6.1)
- **Behçet's Disease:** The most common adverse reactions (≥ 10%) are diarrhea, nausea, headache, and upper respiratory tract infection (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Amgen Inc. at 1-800-77-AMGEN (1-800-772-6436) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

USE IN SPECIFIC POPULATIONS

Severe Renal Impairment: Increased systemic exposure of OTEZLA has been observed. For adults and for pediatric patients weighing 50 kg or more, reduce dosage to OTEZLA 30 mg once daily. For pediatric patients weighing 20 kg to less than 50 kg, reduce dosage to OTEZLA 20 mg once daily (2.3, 8.6).

See 17 for PATIENT COUNSELING INFORMATION

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

1.1 Psoriatic Arthritis

OTEZLA is indicated for the treatment of adult patients and pediatric patients 6 years of age and older and weighing at least 20 kg with active psoriatic arthritis.

OTEZLA XR is indicated for the treatment of adult patients and pediatric patients 6 years of age and older and weighing at least 50 kg with active psoriatic arthritis.

1.2 Plaque Psoriasis

OTEZLA/OTEZLA XR is indicated for the treatment of adult patients with plaque psoriasis who are candidates for phototherapy or systemic therapy.

OTEZLA is indicated for the treatment of pediatric patients 6 years of age and older and weighing at least 20 kg with moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy.

OTEZLA XR is indicated for the treatment of pediatric patients 6 years of age and older and weighing at least 50 kg with moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy.

1.3 Oral Ulcers Associated with Behçet's Disease

OTEZLA/OTEZLA XR is indicated for the treatment of adult patients with oral ulcers associated with Behçet's Disease.

2 DOSAGE AND ADMINISTRATION

2.1 Recommended Dosage in Adult and Pediatric Patients with Psoriatic Arthritis, Plaque Psoriasis, and Behçet's Disease

Adult Patients with Psoriatic Arthritis, Plaque Psoriasis, or Behçet's Disease

The recommended initial dosage titration from Day 1 to Day 5 is shown in Table 1. Following the 5-day titration with OTEZLA, the recommended maintenance dosage is OTEZLA 30 mg twice daily or OTEZLA XR 75 mg once daily taken orally starting on Day 6. This titration is intended to reduce the gastrointestinal symptoms associated with initial therapy.

Table 1. Dosage Titration Schedule for Adult Patients with Psoriatic Arthritis, Plaque Psoriasis, or Behçet's Disease

OTEZLA Dosage Titration ^a									OTEZLA/OTEZLA XR Maintenance Dosage
Day 1	Day 2		Day 3		Day 4		Day 5		Day 6 & thereafter
AM	AM	PM	AM	PM	AM	PM	AM	PM	
10 mg	10 mg	10 mg	10 mg	20 mg	20 mg	20 mg	20 mg	30 mg	OTEZLA 30 mg BID OR OTEZLA XR 75 mg QD

BID = twice daily; QD = once daily

^aOTEZLA tablets should be used for the initial titration regardless of whether OTEZLA or OTEZLA XR will be used for the maintenance dosage.

Pediatric Patients 6 Years of Age and Older and Weighing at Least 20 kg with Psoriatic Arthritis, Moderate to Severe Plaque Psoriasis

The recommended dosage for pediatric patients 6 years of age and older and weighing at least 20 kg with psoriatic arthritis or moderate to severe plaque psoriasis is based on body weight. Following the appropriate initial titration schedule shown in Table 2, the recommended maintenance dosage is:

- *For pediatric patients who weigh at least 50 kg: OTEZLA 30 mg twice daily or OTEZLA XR 75 mg once daily taken orally*
- *For pediatric patients who weigh from 20 kg to less than 50 kg: OTEZLA 20 mg twice daily taken orally*

The initial titration is intended to reduce the gastrointestinal symptoms associated with initial therapy.

Table 2. Dosage Titration Schedule for Pediatric Patients 6 Years of Age and Older and Weighing at Least 20 kg with Psoriatic Arthritis or Moderate to Severe Plaque Psoriasis

	OTEZLA Dosage Titration ^a									OTEZLA/OTEZLA XR Maintenance Dosage
Body Weight	Day 1	Day 2		Day 3		Day 4		Day 5		Day 6 & thereafter
	AM	AM	PM	AM	PM	AM	PM	AM	PM	
50 kg or more	10 mg	10 mg	10 mg	10 mg	20 mg	20 mg	20 mg	20 mg	30 mg	OTEZLA 30 mg BID OR OTEZLA XR 75 mg QD
20 kg to less	10 mg	10 mg	10 mg	10 mg	20 mg	20 mg	20 mg	20 mg	20 mg	OTEZLA 20 mg BID

than 50 kg										
---------------	--	--	--	--	--	--	--	--	--	--

BID = twice daily; QD = once daily

^a OTEZLA tablets should be used for the initial titration regardless of whether OTEZLA or OTEZLA XR will be used for the maintenance dosage.

2.2 Switching Between OTEZLA and OTEZLA XR

Patients treated with OTEZLA 30 mg twice daily may be switched to OTEZLA XR 75 mg once daily the day following the last dose of OTEZLA 30 mg.

Patients treated with OTEZLA XR 75 mg once daily may be switched to OTEZLA 30 mg twice daily the day following the last dose of OTEZLA XR 75 mg.

2.3 Dosage Adjustment in Adult and Pediatric Patients with Severe Renal Impairment

Adult Patients with Psoriatic Arthritis, Plaque Psoriasis, or Behçet's Disease

For initial dosage titration in adult patients with severe renal impairment (creatinine clearance [CL_{cr}] of less than 30 mL per minute estimated by the Cockcroft–Gault equation), titrate OTEZLA using only the AM schedule listed in Table 1 and skip the PM doses. The recommended maintenance dosage in this group is OTEZLA 30 mg once daily [*see Use in Specific Populations (8.6) and Clinical Pharmacology (12.3)*].

OTEZLA XR is not recommended for adult patients with severe renal impairment; the appropriate dosage for these patients has not been determined [*see Use in Specific Populations (8.6) and Clinical Pharmacology (12.3)*].

Pediatric Patients 6 Years of Age and Older and Weighing at Least 20 kg with Psoriatic Arthritis or Moderate to Severe Plaque Psoriasis

For initial dosage titration in pediatric patients 6 years of age and older and weighing at least 20 kg with psoriatic arthritis or moderate to severe plaque psoriasis and severe renal impairment (CL_{cr} of less than 30 mL per minute estimated by the Cockcroft–Gault equation), titrate OTEZLA using only the AM schedule listed in Table 2 for the appropriate body weight category and skip the PM doses. The recommended maintenance dosage is:

- For pediatric patients who weigh at least 50 kg: OTEZLA 30 mg once daily taken orally
- For pediatric patients who weigh 20 kg to less than 50 kg: OTEZLA 20 mg once daily taken orally

OTEZLA XR is not recommended for pediatric patients with severe renal impairment; the appropriate dosage for these patients has not been determined [*see Use in Specific Populations (8.6) and Clinical Pharmacology (12.3)*].

2.4 Important Administration Instructions

- Administer OTEZLA/OTEZLA XR with or without food.
- Swallow tablets whole. Do not crush, split, or chew.

3 DOSAGE FORMS AND STRENGTHS

OTEZLA is available as diamond shaped, film-coated tablets in the following dosage strengths:

- 10-mg pink tablet engraved with “APR” on one side and “10” on the other side
- 20-mg brown tablet engraved with “APR” on one side and “20” on the other side
- 30-mg beige tablet engraved with “APR” on one side and “30” on the other side

OTEZLA XR is available as 75 mg round, biconvex, pink, film-coated extended-release tablets with “APR 75” printed in black on one side and a hole or indentation on either side of the tablet, which may or may not be visible.

4 CONTRAINDICATIONS

OTEZLA/OTEZLA XR is contraindicated in patients with a known hypersensitivity to apremilast or to any of the excipients in the formulation [see *Warnings and Precautions (5.1)*, see *Adverse Reactions (6.1)*].

5 WARNINGS AND PRECAUTIONS

5.1 Hypersensitivity

Hypersensitivity reactions, including cases of angioedema and anaphylaxis, have been reported during post marketing surveillance. Avoid the use of OTEZLA/OTEZLA XR in patients with known hypersensitivity to apremilast or to any of the excipients in the formulation. If signs or symptoms of serious hypersensitivity reactions develop during treatment, discontinue OTEZLA/OTEZLA XR and institute appropriate therapy.

5.2 Diarrhea, Nausea, and Vomiting

There have been reports of severe diarrhea, nausea, and vomiting associated with the use of OTEZLA. Most events occurred within the first few weeks of treatment. In some cases, patients were hospitalized. Patients 65 years of age or older and patients taking medications that can lead to volume depletion or hypotension may be at a higher risk of complications from severe diarrhea, nausea, or vomiting. Monitor patients who are more susceptible to complications of diarrhea or vomiting. Patients who reduced dosage or discontinued OTEZLA generally improved quickly. Consider OTEZLA/OTEZLA XR dosage reduction or suspension if patients develop severe diarrhea, nausea, or vomiting.

5.3 Depression

Treatment with apremilast is associated with an increased incidence of depression. Before using OTEZLA/OTEZLA XR in patients with a history of depression and/or suicidal thoughts or behavior, carefully weigh the risks and benefits of treatment with OTEZLA/OTEZLA XR. Advise patients, their caregivers, and families of the need to be alert for the emergence or worsening of depression, suicidal thoughts or other mood changes, and if such changes occur to contact their healthcare provider. Carefully evaluate the risks and benefits of continuing treatment with OTEZLA/OTEZLA XR if such events occur.

Psoriatic Arthritis: During the 16-week placebo-controlled period of the 3 controlled clinical trials, 1.0% (10/998) of subjects treated with OTEZLA reported depression or depressed mood compared to 0.8% (4/495) treated with placebo. During the clinical trials, 0.3% (4/1441) of subjects treated with OTEZLA

discontinued treatment due to depression or depressed mood compared with none in placebo treated subjects (0/495). Depression was reported as serious in 0.2% (3/1441) of subjects exposed to OTEZLA, compared to none in placebo-treated subjects (0/495). Instances of suicidal ideation and behavior have been observed in 0.2% (3/1441) of subjects while receiving OTEZLA, compared to none in placebo treated subjects (0/495). In the clinical trials, 2 subjects who received placebo committed suicide compared to none in OTEZLA-treated subjects.

Plaque Psoriasis: During the 16-week placebo-controlled period of the 3 controlled clinical trials in adult subjects with moderate to severe plaque psoriasis, 1.3% (12/920) of subjects treated with OTEZLA reported depression compared to 0.4% (2/506) treated with placebo. During the clinical trials, 0.1% (1/1308) of subjects treated with OTEZLA discontinued treatment due to depression compared with none in placebo-treated subjects (0/506). Depression was reported as serious in 0.1% (1/1308) of subjects exposed to OTEZLA, compared to none in placebo-treated subjects (0/506). Instances of suicidal behavior have been observed in 0.1% (1/1308) of subjects while receiving OTEZLA, compared to 0.2% (1/506) in placebo-treated subjects. In the clinical trials, one subject treated with OTEZLA attempted suicide while one who received placebo committed suicide.

During the 16-week placebo-controlled period of the clinical trial in adults with mild to moderate plaque psoriasis, the incidence of subjects reporting depression was similar to what was observed in the adult moderate to severe plaque psoriasis trials.

Behçet's Disease: During the placebo-controlled period of the phase 3 trial, 1% (1/104) of subjects treated with OTEZLA reported depression/depressed mood compared to 1% (1/103) treated with placebo. None of these reports of depression was serious or led to discontinuation from the trial. No instances of suicidal ideation or behavior were reported during the placebo-controlled period of the phase 3 trial in subjects treated with OTEZLA (0/104) or treated with placebo (0/103).

5.4 Weight Decrease

Weight loss may occur in adult or pediatric patients treated with OTEZLA/OTEZLA XR.

Regularly monitor the weight of patients treated with OTEZLA/OTEZLA XR. If unexplained or clinically significant weight loss occurs, evaluate weight loss and consider discontinuation of OTEZLA/OTEZLA XR [see *Adverse Reactions* (6.1)].

Weight Loss in Adult Patients

During the placebo-controlled period of the trials in psoriatic arthritis (PsA), weight decrease between 5%-10% of body weight was reported in 10% (49/497) of subjects treated with OTEZLA 30 mg twice daily compared to 3.3% (16/495) treated with placebo.

During the placebo-controlled period of the trials in adults with moderate to severe plaque psoriasis, weight decrease between 5%-10% of body weight occurred in 12% (96/784) of subjects treated with OTEZLA compared to 5% (19/382) treated with placebo. Weight decrease of $\geq 10\%$ of body weight occurred in 2% (16/784) of subjects treated with OTEZLA 30 mg twice daily compared to 1% (3/382) subjects treated with placebo.

During the placebo-controlled period of the clinical trial in adults with mild to moderate plaque psoriasis, weight decrease was similar to what was observed in the trials of adults with moderate to severe plaque psoriasis.

During the placebo-controlled period of the phase 3 trial in Behçet's Disease, weight decrease > 5% of body weight was reported in 4.9% (5/103) of subjects treated with OTEZLA 30 mg twice daily compared to 3.9% (4/102) subjects treated with placebo.

Weight Loss in Pediatric Patients

During the placebo-controlled period of the clinical trial in pediatric subjects 6 years of age and older with moderate to severe plaque psoriasis, weight decrease between 5%-10% of body weight occurred in 12% (19/163) of pediatric subjects treated with OTEZLA compared to 2.5% (2/80) of pediatric subjects treated with placebo. Weight decrease of $\geq 10\%$ of body weight occurred in 1% (1/163) of pediatric subjects treated with OTEZLA twice daily compared to 0% (0/80) of pediatric subjects treated with placebo.

Closely monitor growth (height and weight) in pediatric patients treated with OTEZLA/OTEZLA XR. Pediatric patients who are not growing or gaining weight as expected may need to have their treatment interrupted.

5.5 Drug Interactions

Co-administration of strong cytochrome P450 enzyme inducer, rifampin, resulted in a reduction of systemic exposure of apremilast, which may result in a loss of efficacy of OTEZLA/OTEZLA XR. Therefore, the use of cytochrome P450 enzyme inducers (e.g., rifampin, phenobarbital, carbamazepine, phenytoin) with OTEZLA/OTEZLA XR is not recommended [see *Drug Interactions (7.1) and Clinical Pharmacology (12.3)*].

6 ADVERSE REACTIONS

The following adverse reactions are described elsewhere in the labeling:

- Hypersensitivity [see *Warnings and Precautions (5.1)*]
- Diarrhea, Nausea, and Vomiting [see *Warnings and Precautions (5.2)*]
- Depression [see *Warnings and Precautions (5.3)*]
- Weight Decrease [see *Warnings and Precautions (5.4)*]
- Drug Interactions [see *Warnings and Precautions (5.5)*]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

Psoriatic Arthritis Clinical Trials

OTEZLA was evaluated in three multicenter, randomized, double-blind, placebo-controlled trials (PsA-1, PsA-2, and PsA-3) of similar design in adult subjects with active psoriatic arthritis [see *Clinical Studies (14.1)*]. Across the three trials, there were 1493 subjects randomized equally to placebo, OTEZLA 20 mg twice daily or OTEZLA 30 mg twice daily. Titration was used over the first 5 days [see *Dosage and Administration (2.1)*]. Placebo subjects whose tender and swollen joint counts had not improved by at least 20% were re-randomized 1:1 in a blinded fashion to either OTEZLA 20 mg twice daily or 30 mg

twice daily at week 16 while OTEZLA subjects remained on their initial treatment. Subjects ranged in age from 18 to 83 years, with an overall median age of 51 years.

The majority of the most common adverse reactions presented in Table 3 occurred within the first 2 weeks of treatment and tended to resolve over time with continued dosing. Diarrhea, headache, and nausea were the most commonly reported adverse reactions. The most common adverse reactions leading to discontinuation for subjects taking OTEZLA were nausea (1.8%), diarrhea (1.8%), and headache (1.2%). The proportion of subjects with psoriatic arthritis who discontinued treatment due to any adverse reaction was 4.6% for subjects taking OTEZLA 30 mg twice daily and 1.2% for placebo-treated subjects.

Table 3. Adverse Reactions Reported in $\geq 2\%$ of Adult Subjects with Active Psoriatic Arthritis on OTEZLA 30 mg Twice Daily and $\geq 1\%$ than That Observed in Subjects on Placebo up to Day 112 (Week 16)

Adverse Reactions	Placebo		OTEZLA 30 mg BID ^d	
	Day 1 to 5 (N = 495) n (%) ^c	Day 6 to Day 112 (N = 490) n (%)	Day 1 to 5 (N = 497) n (%)	Day 6 to Day 112 (N = 493) n (%)
Diarrhea ^a	6 (1.2)	8 (1.6)	46 (9.3)	38 (7.7)
Nausea ^a	7 (1.4)	15 (3.1)	37 (7.4)	44 (8.9)
Headache ^a	9 (1.8)	11 (2.2)	24 (4.8)	29 (5.9)
Upper respiratory tract infection ^b	3 (0.6)	9 (1.8)	3 (0.6)	19 (3.9)
Vomiting ^a	2 (0.4)	2 (0.4)	4 (0.8)	16 (3.2)
Nasopharyngitis ^b	1 (0.2)	8 (1.6)	1 (0.2)	13 (2.6)
Abdominal pain upper ^b	0 (0.0)	1 (0.2)	3 (0.6)	10 (2.0)

^a Of the reported gastrointestinal adverse reactions, 1 subject experienced a serious adverse reaction of nausea and vomiting in OTEZLA 30 mg twice daily; 1 subject treated with OTEZLA 20 mg twice daily experienced a serious adverse reaction of diarrhea; 1 subject treated with OTEZLA 30 mg twice daily experienced a serious adverse reaction of headache.

^b Of the reported adverse drug reactions none were serious.

^c n (%) indicates number of subjects and percent.

^d BID = twice daily.

Moderate to Severe Plaque Psoriasis Clinical Trials

Adverse Reactions from Clinical Trials in Adults

The safety of OTEZLA was assessed in 1426 subjects in three randomized, double-blind, placebo-controlled trials in adult subjects with moderate to severe plaque psoriasis who were candidates for phototherapy or systemic therapy. Subjects were randomized to receive OTEZLA 30 mg twice daily or placebo twice daily. Titration was used over the first 5 days [see *Dosage and Administration (2.1)*]. Subjects ranged in age from 18 to 83 years, with an overall median age of 46 years.

Diarrhea, nausea, and upper respiratory tract infection were the most commonly reported adverse reactions (see Table 4). The most common adverse reactions leading to discontinuation for subjects taking OTEZLA were nausea (1.6%), diarrhea (1.0%), and headache (0.8%). The proportion of subjects with plaque psoriasis who discontinued treatment due to any adverse reaction was 6.1% for subjects treated with OTEZLA 30 mg twice daily and 4.1% for placebo-treated subjects.

Table 4. Adverse Reactions Reported in $\geq 1\%$ of Adult Subjects with Moderate to Severe Plaque Psoriasis on OTEZLA and With Greater Frequency Than in Subjects on Placebo up to Day 112 (Week 16)

Adverse Reactions	Placebo (N = 506) n (%)	OTEZLA 30 mg BID ^b (N = 920) n (%)
Diarrhea	32 (6)	160 (17)
Nausea	35 (7)	155 (17)
Upper respiratory tract infection	31 (6)	84 (9)
Tension headache	21 (4)	75 (8)
Headache	19 (4)	55 (6)
Abdominal pain ^a	11 (2)	39 (4)
Vomiting	8 (2)	35 (4)
Fatigue	9 (2)	29 (3)
Dyspepsia	6 (1)	29 (3)
Decreased appetite	5 (1)	26 (3)
Insomnia	4 (1)	21 (2)
Back pain	4 (1)	20 (2)
Migraine	5 (1)	19 (2)
Frequent bowel movements	1 (0)	17 (2)
Depression	2 (0)	12 (1)
Bronchitis	2 (0)	12 (1)
Tooth abscess	0 (0)	10 (1)
Folliculitis	0 (0)	9 (1)
Sinus headache	0 (0)	9 (1)

^a Two subjects treated with OTEZLA experienced serious adverse reaction of abdominal pain.

^b BID = twice daily.

Severe worsening of psoriasis (rebound) occurred in 0.3% (4/1184) subjects following discontinuation of treatment with OTEZLA.

OTEZLA was evaluated in a Phase 3, multicenter, randomized, placebo-controlled trial (PSOR-3) in adults with moderate to severe plaque psoriasis of the scalp [see *Clinical Studies (14.2)*]. A total of 302 subjects were randomized to receive OTEZLA 30 mg twice daily or placebo twice daily. The most commonly reported adverse reactions that occurred at a higher rate in the OTEZLA group than in the placebo group were: diarrhea (31% vs. 11%), nausea (22% vs. 6%), headache (12% vs. 5%), and vomiting (6% vs. 2%). The proportion of subjects who discontinued treatment because of any adverse reaction during the 16-week placebo-controlled period of the trial was 6% for subjects who received OTEZLA 30 mg twice daily and 3% for subjects who received placebo. Gastrointestinal adverse reactions that led to discontinuation of treatment were diarrhea (3% vs. 0%), nausea (1.5% vs. 1%), and vomiting (1.5% vs. 0%) in the OTEZLA group compared to placebo.

OTEZLA was evaluated in a Phase 3, multicenter, randomized, placebo-controlled trial (PSOR-5) in adults with moderate to severe plaque psoriasis of the genital area [see *Clinical Studies (14.2)*]. A total of

289 subjects were randomized to receive OTEZLA 30 mg twice daily or placebo twice daily. Overall, the safety profile observed in the OTEZLA group during the placebo-controlled phase was consistent with the safety profile previously established in adult subjects with moderate to severe plaque psoriasis.

Adverse Reactions from Clinical Trials in Pediatric Subjects 6 to 17 Years of Age

OTEZLA was evaluated in a Phase 3, multicenter, randomized, placebo-controlled trial (PSOR-6) in pediatric subjects 6 to 17 years of age with moderate to severe plaque psoriasis [see *Clinical Studies (14.3)*]. A total of 245 subjects were randomized to receive OTEZLA (163 subjects, at a dosage of 20 mg twice daily or 30 mg twice daily, based on body weight) or placebo (82 subjects) twice daily during the 16-week placebo-controlled phase of the trial. The trial also included a 36-week extension phase during which all subjects received OTEZLA 20 mg or 30 mg twice daily. Overall, the safety profile observed in pediatric subjects treated with OTEZLA during the study was consistent with the safety profile established in adult subjects with moderate to severe plaque psoriasis.

Mild to Moderate Plaque Psoriasis Clinical Trial in Adults

OTEZLA was evaluated in a Phase 3, multicenter, randomized, placebo-controlled trial (PSOR-4) in adult subjects with mild to moderate plaque psoriasis [see *Clinical Studies (14.4)*]. A total of 595 subjects were randomized to receive OTEZLA 30 mg twice daily (297 subjects) or placebo twice daily (298 subjects) during the placebo-controlled phase of the trial. The trial also included an open label extension phase during which all subjects received OTEZLA 30 mg twice daily. Overall, the safety profile observed in the OTEZLA group during the placebo-controlled phase was consistent with the safety profile previously established in adult subjects with moderate to severe plaque psoriasis.

Behçet's Disease Clinical Trials

OTEZLA was evaluated in a Phase 3, multicenter, randomized, placebo-controlled trial (BCT-002) in adult subjects with Behçet's Disease (BD) with active oral ulcers [see *Clinical Studies (14.5)*]. A total of 207 subjects were randomized to receive OTEZLA 30 mg twice daily or placebo twice daily. Titration was used over the first 5 days [see *Dosage and Administration (2.1)*]. After Week 12, all subjects received treatment with OTEZLA 30 mg twice daily. Subjects ranged in age from 19 to 72, with a mean age of 40 years.

Diarrhea, nausea, headache, and upper respiratory tract infection were the most commonly reported adverse reactions (see Table 5). The proportion of subjects with BD who discontinued treatment due to any adverse reaction during the placebo-controlled period of the trial, was 2.9% for subjects treated with OTEZLA 30 mg twice daily and 4.9% for placebo-treated subjects.

Table 5. Adverse Reactions Reported in $\geq 5\%$ of Adult Subjects with BD with Active Oral Ulcers on OTEZLA and with at Least 1% Greater Frequency than Subjects on Placebo up to Week 12

Adverse Reactions	Placebo (N = 103) n (%)	OTEZLA 30 mg twice daily (N = 104) n (%)
Diarrhea ^a	21 (20.4)	43 (41.3)
Nausea ^a	11 (10.7)	20 (19.2)
Headache	11 (10.7)	15 (14.4)
Upper respiratory tract infection	5 (4.9)	12 (11.5)
Abdominal pain upper	2 (1.9)	9 (8.7)
Vomiting ^a	2 (1.9)	9 (8.7)
Back pain	6 (5.8)	8 (7.7)
Viral upper respiratory tract infection	5 (4.9)	7 (6.7)
Arthralgia	3 (2.9)	6 (5.8)

^a There were no serious adverse reactions of diarrhea, nausea or vomiting.

Other adverse reactions reported in subjects on OTEZLA in psoriatic arthritis, plaque psoriasis, and Behçet's Disease clinical trials are:

- Gastrointestinal Disorders: Gastroesophageal reflux disease
- Immune System Disorders: Hypersensitivity
- Investigations: Weight decrease
- Metabolism and Nutrition Disorders: Decreased appetite*
- Nervous System Disorders: Migraine
- Respiratory, Thoracic, and Mediastinal Disorders: Cough
- Skin and Subcutaneous Tissue Disorders: Rash

* 1 subject treated with OTEZLA 30 mg twice daily experienced a serious adverse reaction.

7 DRUG INTERACTIONS

7.1 Strong CYP450 Inducers

Co-administration with strong CYP450 inducers (such as rifampin) decreases apremilast exposure and may result in loss of efficacy of OTEZLA/OTEZLA XR [see *Warnings and Precautions (5.5) and Clinical Pharmacology (12.3)*].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Exposure Registry

There is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to OTEZLA during pregnancy. Information about the registry can be obtained by calling 1-877-311-8972 or visiting <https://mothertobaby.org/ongoing-study/otezla/>.

Risk Summary

Available pharmacovigilance data with OTEZLA use in pregnant women have not established a drug-associated risk of major birth defects, miscarriage or adverse maternal or fetal outcomes, but these data are extremely limited. Based on findings from animal reproduction studies with apremilast, OTEZLA/OTEZLA XR may increase the risk for fetal loss. In animal embryo-fetal development studies, the administration of apremilast to pregnant cynomolgus monkeys during organogenesis resulted in dose-related increases in abortion/embryo-fetal death at dose exposures approximately 2-times the maximum recommended human therapeutic dose (MRHD) and no adverse effect at an exposure of 1.4-times the MRHD. When administered to pregnant mice, during organogenesis there were no apremilast-induced malformations up to exposures 4-times the MRHD (*see Data*). Advise pregnant women of the potential risk of fetal loss. Consider pregnancy planning and prevention for females of reproductive potential.

The background risk of major birth defects and miscarriage for the indicated populations is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.

Data

Animal Data

In an embryo-fetal developmental study, pregnant cynomolgus monkeys were administered apremilast at doses of 20, 50, 200, or 1000 mg/kg/day during the period of organogenesis (gestation Days [GD] 20 through 50). There was a dose-related increase in spontaneous abortions, with most abortions occurring during Weeks 3 to 4 of dosing in the first trimester, at doses approximately 2-times the MRHD and greater (on an area under the curve [AUC] basis at doses ≥ 50 mg/kg/day). No abortifacient effects were observed at a dose approximately 1.4-times the MRHD (on an AUC basis at a dose of 20 mg/kg/day). Although, there was no evidence for a teratogenic effect at doses of 20 mg/kg/day and greater when examined at Day 100, aborted fetuses were not examined.

In an embryo-fetal development study in mice, apremilast was administered at doses of 250, 500, or 750 mg/kg/day to dams during organogenesis (GD 6 through 15). In a combined fertility and embryo-fetal development study in mice, apremilast was administered at doses of 10, 20, 40, or 80 mg/kg/day starting 15 days before cohabitation and continuing through GD 15. No teratogenic findings attributed to apremilast were observed in either study; however, there was an increase in post-implantation loss at doses corresponding to a systemic exposure of approximately 2-times the MRHD and greater (≥ 20 mg/kg/day). At doses of ≥ 20 mg/kg/day skeletal variations included incomplete ossification sites of tarsals, skull, sternebra, and vertebrae. No effects were observed at a dose approximately 1.3-times the MRHD (10 mg/kg/day).

Apremilast distributed across the placenta into the fetal compartment in mice and monkeys.

In a pre and postnatal study in mice, apremilast was administered to pregnant female mice at doses of 10, 80, or 300 mg/kg/day from Day 6 of gestation through Day 20 of lactation, with weaning on Day 21. Dystocia, reduced viability, and reduced birth weights occurred at doses corresponding to ≥ 4 -times the MRHD (on an AUC basis at doses ≥ 80 mg/kg/day). No adverse effects occurred at a dose 1.3-times the MRHD (10 mg/kg/day). There was no evidence for functional impairment of physical development, behavior, learning ability, immune competence, or fertility in the offspring at doses up to 7.5-times the MRHD (on an AUC basis at a dose of 300 mg/kg/day).

8.2 Lactation

Risk Summary

There are no data on the presence of apremilast in human milk, its effects on the breastfed infant, or its effects on milk production. However, apremilast was detected in the milk of lactating mice. When a drug is present in animal milk, it is likely that the drug will be present in human milk. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for OTEZLA/OTEZLA XR and any potential adverse effects on the breastfed infant from OTEZLA/OTEZLA XR or from the underlying maternal condition.

Data

In mice, following a single oral administration of 10 mg/kg to dams on postpartum Day 13, apremilast concentrations in milk were approximately 1.5-times that of simultaneously collected blood samples.

8.4 Pediatric Use

OTEZLA

Plaque Psoriasis

The safety and effectiveness of OTEZLA have been established in pediatric patients 6 years of age and older and weighing at least 20 kg with moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy. Use of OTEZLA in these patients is supported by evidence from a 52-week adequate and well-controlled clinical trial (PSOR-6) in 245 pediatric subjects 6 years of age and older with moderate to severe plaque psoriasis. Weight loss in OTEZLA-treated pediatric subjects was comparable to weight loss observed in adults [*see Warnings and Precautions (5.4), Adverse Reactions (6.1) and Clinical Studies (14.3)*].

Closely monitor growth (height and weight) in pediatric patients treated with OTEZLA. Pediatric patients who are not growing or gaining weight as expected may need to have their treatment interrupted.

The safety and effectiveness of OTEZLA have not been established in pediatric patients below the age of 6 years or weighing less than 20 kg with moderate to severe plaque psoriasis.

Psoriatic Arthritis

The safety and effectiveness of OTEZLA have been established for pediatric patients 6 years of age and older and weighing at least 20 kg with psoriatic arthritis. Use of OTEZLA in these patients is supported by evidence from adequate and well controlled trials of OTEZLA in adults with psoriatic arthritis, pharmacokinetic data from adult patients with psoriatic arthritis, adult patients with psoriasis, and pediatric patients with psoriasis, and safety data from a clinical trial in 245 pediatric patients 6 years of age and older with psoriasis. Steady-state exposure of OTEZLA in pediatric patients with psoriatic arthritis is estimated to be comparable to adults with psoriatic arthritis and pediatric patients with psoriasis [*see Clinical Pharmacology (12.3)*].

Closely monitor growth (height and weight) in OTEZLA-treated pediatric patients. Pediatric patients who are not growing or gaining weight as expected may need to have their treatment interrupted [*see Warnings and Precautions (5.4)*].

The safety and effectiveness of OTEZLA have not been established in pediatric patients below the age of 6 years or weighing less than 20 kg with psoriatic arthritis.

Behçet's Disease

The safety and effectiveness of OTEZLA have not been established in pediatric patients with psoriatic arthritis or oral ulcers associated with Behçet's Disease.

OTEZLA XR

Plaque Psoriasis and Psoriatic Arthritis

The safety and effectiveness of OTEZLA XR have been established for the treatment of moderate to severe plaque psoriasis and psoriatic arthritis in pediatric patients 6 years of age and older and weighing at least 50 kg. Use of OTEZLA XR in these patients is supported by pharmacokinetic data from healthy adults demonstrating comparable PK exposure between OTEZLA XR 75 mg once daily and OTEZLA 30 mg twice daily, which is the recommended OTEZLA dosage for pediatric patients weighing at least 50 kg [see *Dosage and Administration (2.1)*, *Clinical Pharmacology (12.3)*].

Closely monitor growth (height and weight) in pediatric patients treated with OTEZLA XR. Pediatric patients who are not growing or gaining weight as expected may need to have their treatment interrupted.

The safety and effectiveness of OTEZLA XR have not been established in pediatric patients below the age of 6 years or weighing less than 50 kg with moderate to severe plaque psoriasis or psoriatic arthritis.

Behçet's Disease

The safety and effectiveness of OTEZLA XR have not been established in pediatric patients with oral ulcers associated with Behçet's Disease.

8.5 Geriatric Use

Of the 1493 patients who enrolled in Trials PsA-1, PsA-2, and PsA-3, a total of 146 (9.8%) psoriatic arthritis patients were 65 years of age and older, including 19 (1.3%) patients 75 years and older. No overall differences were observed in the safety profile of geriatric patients $\geq$ 65 years of age and younger adult patients $<$ 65 years of age in the clinical trials.

Of the 1257 subjects who enrolled in two placebo-controlled plaque psoriasis trials (PSOR-1 and PSOR-2), a total of 108 (8.6%) plaque psoriasis patients were 65 years of age and older, including 9 (0.7%) patients who were 75 years of age and older. No overall differences were observed in the safety or effectiveness in geriatric patients $\geq$ 65 years of age and younger adult patients $<$ 65 years of age in the clinical trials.

Because patients 65 years of age or older may be at a higher risk of complications such as volume depletion or hypotension from severe diarrhea, nausea, or vomiting, monitor geriatric patients closely for such complications [see *Warnings and Precautions (5.2)*].

8.6 Renal Impairment

OTEZLA pharmacokinetics were characterized in adult subjects with mild, moderate, and severe renal impairment as defined by a creatinine clearance of 60-89, 30-59, and less than 30 mL per minute, respectively, by the Cockcroft–Gault equation. No dosage adjustment is needed in patients with mild or moderate renal impairment. In adult patients with severe renal impairment, reduce the maintenance dosage to OTEZLA 30 mg once daily. In pediatric patients 6 years of age and older and weighing at least 20 kg with psoriatic arthritis or moderate to severe plaque psoriasis and severe renal impairment, reduce the maintenance dosage to OTEZLA 30 mg once daily for pediatric patients weighing at least 50 kg and to OTEZLA 20 mg once daily for pediatric patients weighing 20 kg to less than 50 kg [see *Dosage and Administration* (2.3) and *Clinical Pharmacology* (12.3)].

The pharmacokinetics of OTEZLA XR has not been evaluated in patients with renal impairment. In patients with severe renal impairment, it is recommended that OTEZLA be used instead of OTEZLA XR [see *Dosage and Administration* (2.3) and *Clinical Pharmacology* (12.3)].

8.7 Hepatic Impairment

Apremilast pharmacokinetics were characterized in subjects with moderate (Child Pugh B) and severe (Child Pugh C) hepatic impairment. No dosage adjustment is necessary in these patients.

11 DESCRIPTION

The active ingredient in OTEZLA/OTEZLA XR tablets is apremilast. Apremilast drug substance is non-hygroscopic. Apremilast drug substance is practically insoluble in water and slightly soluble in alcohol.

Apremilast is a phosphodiesterase 4 (PDE4) inhibitor. Apremilast is known chemically as N-[2-[(1S)-1-(3-ethoxy-4-methoxyphenyl)-2-(methylsulfonyl)ethyl]-2,3-dihydro-1,3-dioxo-1H-isoindol-4-yl]acetamide. Its empirical formula is C₂₂H₂₄N₂O₇S and the molecular weight is 460.5.

The chemical structure is:

OTEZLA (apremilast) tablets are supplied in 10 mg, 20 mg, and 30 mg strengths for oral administration. Each tablet contains apremilast as the active ingredient and the following inactive ingredients: croscarmellose sodium, iron oxide red, iron oxide yellow (20 and 30 mg only), iron oxide black (30 mg only), lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polyvinyl alcohol, talc, titanium dioxide.

OTEZLA XR (apremilast) extend-ed-release tablets are supplied in a 75 mg strength for oral administration. Each tablet contains apremilast as the active ingredient and the following inactive ingredients: cellulose acetate, colloidal silicon dioxide, ferrosoferric oxide, hydroxypropyl

methylcellulose acetate succinate, hypromellose, iron oxide red, magnesium stearate, mannitol, microcrystalline cellulose, polyethylene glycol, polyethylene oxide, sodium chloride, titanium dioxide.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Apremilast is an oral small molecule inhibitor of phosphodiesterase 4 (PDE4) specific for cyclic adenosine monophosphate (cAMP). PDE4 inhibition results in increased intracellular cAMP levels. The specific mechanism(s) by which apremilast exerts its therapeutic action is not well defined.

12.2 Pharmacodynamics

In clinical studies, apremilast decreased IL-17, IL-22 and TNF-alpha levels circulating in blood and reduced expression of these pro-inflammatory cytokine genes in skin. The clinical implications of these pharmacodynamic responses remain unclear.

12.3 Pharmacokinetics

Absorption

OTEZLA when taken orally is absorbed with an absolute bioavailability of ~73%, with peak plasma concentrations (C_{max}) occurring at a median time (t_{max}) of ~2.5 hours. Co-administration with food does not alter the extent of absorption of OTEZLA.

OTEZLA XR when taken orally is absorbed with peak plasma concentrations (C_{max}) occurring at a median time (t_{max}) of ~6 hours. OTEZLA XR 75 mg administered once daily demonstrates comparable PK exposure (steady-state AUC and C_{max}) to OTEZLA 30 mg twice daily. When administered with a high-fat meal, OTEZLA XR t_{max} was delayed by 3 hours and C_{max} and AUC were increased by ~28% compared to fasted conditions. Therefore, OTEZLA XR may be taken without regard to meals.

Distribution

Human plasma protein binding of apremilast is approximately 68%. Mean apparent volume of distribution (V_d) is 87 L.

Metabolism

Following oral administration in humans, apremilast is a major circulating component (45%) followed by inactive metabolite M12 (39%), a glucuronide conjugate of O-demethylated apremilast. It is extensively metabolized in humans with up to 23 metabolites identified in plasma, urine and feces. Apremilast is metabolized by both cytochrome (CYP) oxidative metabolism with subsequent glucuronidation and non-CYP mediated hydrolysis. *In vitro*, CYP metabolism of apremilast is primarily mediated by CYP3A4, with minor contributions from CYP1A2 and CYP2A6.

Elimination

The plasma clearance of apremilast is about 10 L/hr in healthy subjects, with a terminal elimination half-life of approximately 6-9 hours. Following oral administration of radiolabeled apremilast, about 58%

and 39% of the radioactivity is recovered in urine and feces, respectively, with about 3% and 7% of the radioactive dose recovered as apremilast in urine and feces, respectively.

Specific Populations

Patients with Hepatic Impairment: The pharmacokinetics of apremilast is not affected by moderate or severe hepatic impairment.

Patients with Renal Impairment: The pharmacokinetics of apremilast is not affected by mild or moderate renal impairment. In 8 adult subjects with severe renal impairment administered a single dose of 30 mg OTEZLA, the AUC and $C_{\max}$ of apremilast increased by approximately 88% and 42%, respectively [see *Dosage and Administration (2.3) and Use in Specific Populations (8.6)*].

The effects of renal impairment have not been studied for OTEZLA XR [see *Dosage and Administration (2.3) and Use in Specific Populations (8.6)*].

Geriatric Patients: A single oral dose of 30-mg apremilast was studied in young adults and elderly healthy subjects. The apremilast exposure in elderly subjects (65 to 85 years of age) was about 13% higher in AUC and about 6% higher in $C_{\max}$ than in young subjects (18 to 55 years of age) [see *Use in Specific Populations (8.5)*].

Pediatric Patients: The pharmacokinetics of OTEZLA were evaluated in a clinical trial in pediatric subjects 6 to 17 years of age with moderate to severe plaque psoriasis at the recommended pediatric dosage regimen [see *Dosage and Administration (2.1) and Clinical Studies (14.3)*]. Population pharmacokinetic analysis indicated that steady-state exposure (AUC and $C_{\max}$) of OTEZLA in pediatric subjects receiving the pediatric maintenance dosage regimen (20 or 30 mg twice daily, based on body weight) was comparable to steady-state exposure in adult subjects at the 30 mg twice daily dosage.

Male and Female Patients: In pharmacokinetic trials in healthy volunteers, the extent of exposure in females was about 31% higher and $C_{\max}$ was about 8% higher than that in male subjects.

Racial or Ethnic Groups: The pharmacokinetics of apremilast in Chinese and Japanese healthy male subjects is comparable to that in White healthy male subjects. In addition, apremilast exposure is similar among White subjects (including Hispanic or Latino and not Hispanic or Latino subjects) and Black or African American subjects.

Drug Interactions

In vitro data: Apremilast is not an inhibitor of CYP1A2, CYP2A6, CYP2B6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, CYP2E1, or CYP3A4 and not an inducer of CYP1A2, CYP2B6, CYP2C9, CYP2C19, or CYP3A4. Apremilast is a substrate, but not an inhibitor of P-glycoprotein (P-gp) and is not a substrate or an inhibitor of organic anion transporter (OAT)1 and OAT3, organic cation transporter (OCT)2, organic anion transporting polypeptide (OATP)1B1 and OATP1B3, or breast cancer resistance protein (BCRP).

Drug interaction trials were performed with apremilast and CYP3A4 substrates (oral contraceptive containing ethinyl estradiol and norgestimate), CYP3A and P-gp inhibitor (ketoconazole), CYP450 inducer (rifampin) and frequently co-administered drug in this patient population (methotrexate).

No significant pharmacokinetic interactions were observed when 30-mg oral apremilast was administered with either oral contraceptive, ketoconazole, or methotrexate. Co-administration of the CYP450 inducer

rifampin (600 mg once daily for 15 days) with a single oral dose of 30-mg apremilast resulted in reduction of apremilast AUC and $C_{\max}$ by 72% and 43%, respectively [see *Warnings and Precautions* (5.5) and *Drug Interactions* (7.1)].

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term studies were conducted in mice and rats with apremilast to evaluate its carcinogenic potential. No evidence of apremilast-induced tumors was observed in mice at oral doses up to approximately 9-times the MRHD on an AUC basis (1000 mg/kg/day) or in rats at oral doses up to approximately 0.08- and 1.1-times the MRHD, (20 mg/kg/day in males and 3 mg/kg/day in females, respectively).

Apremilast tested negative in the Ames assay, *in vitro* chromosome aberration assay of human peripheral blood lymphocytes, and the *in vivo* mouse micronucleus assay.

In a fertility study of male mice, apremilast at oral doses up to approximately 3-times the MRHD based on AUC (up to 50 mg/kg/day) produced no effects on male fertility. In a fertility study of female mice, apremilast was administered at oral doses of 10, 20, 40, or 80 mg/kg/day. At doses $\geq$ 1.8-times the MRHD ($\geq$ 20 mg/kg/day), estrous cycles were prolonged, due to lengthening of diestrus which resulted in a longer interval until mating. Mice that became pregnant at doses of 20 mg/kg/day and greater also had increased incidences of early post-implantation losses. There was no effect of apremilast approximately 1.0-times the MRHD (10 mg/kg/day).

14 CLINICAL STUDIES

14.1 Adult Psoriatic Arthritis

The safety and efficacy of OTEZLA was evaluated in three multicenter, randomized, double-blind, placebo-controlled trials (PsA-1 [NCT01172938], PsA-2 [NCT01212757], and PsA-3 [NCT01212770]) of similar design. A total of 1493 adult subjects with active PsA ($\geq$ 3 swollen joints and $\geq$ 3 tender joints) despite prior or current treatment with disease-modifying antirheumatic drug (DMARD) therapy were randomized. Subjects enrolled in these trials had a diagnosis of PsA for at least 6 months. One qualifying psoriatic skin lesion of at least 2 cm in diameter was required in Trial PsA-3. Previous treatment with a biologic, including TNF blockers was allowed (up to 10% could be TNF blocker therapeutic failures). Across the three trials, subjects were randomly assigned to placebo (n = 496), OTEZLA 20 mg (n = 500), or OTEZLA 30 mg (n = 497) given orally twice daily. Titration was used over the first 5 days [see *Dosage and Administration* (2.1)]. Subjects were allowed to receive stable doses of concomitant methotrexate [MTX ($\leq$ 25 mg/week)], sulfasalazine [SSZ ($\leq$ 2 g/day)], leflunomide [LEF ($\leq$ 20 mg/day)], low dose oral corticosteroids (equivalent to $\leq$ 10 mg of prednisone a day), and/or nonsteroidal anti-inflammatory drugs (NSAIDs) during the trial. Treatment assignments were stratified based on small molecule DMARD use at baseline in Trials PsA-1, PsA-2 and PsA-3. There was an additional stratification of body surface area (BSA) $>$ 3% with psoriasis in Trial PsA-3. The subjects who were therapeutic failures of $>$ 3 agents for PsA (small molecules or biologics), or $>$ 1 biologic TNF blocker were excluded.

The primary endpoint was the percentage of subjects achieving American College of Rheumatology (ACR) 20 response at Week 16. Placebo-controlled efficacy data were collected and analyzed through Week 24. Subjects whose tender and swollen joint counts had not improved by at least 20% were

considered non-responders at Week 16. Placebo non-responders were re-randomized 1:1 in a blinded fashion to either OTEZLA 20 mg twice daily or 30 mg twice daily following the titration schema [see *Dosage and Administration (2.1)*]. OTEZLA subjects remained on their initial treatment. At Week 24, all remaining placebo subjects were re-randomized to either 20 mg twice daily or 30 mg twice daily.

Subjects with subtypes of PsA were enrolled across the three trials, including symmetric polyarthritis (62.0%), asymmetric oligoarthritis (27.0%), distal interphalangeal (DIP) joint arthritis (6.0%), arthritis mutilans (3.0%), and predominant spondylitis (2.1%). The median duration of PsA disease was 5 years. Subjects received concomitant therapy with at least one DMARD (65.0%), MTX (55.0%), SSZ (9.0%), LEF (7.0%), low dose oral corticosteroids (14.0%), and NSAIDs (71.0%). Prior treatment with small molecule DMARDs only was reported in 76.0% of subjects and prior treatment with biologic DMARDs was reported in 22.0% of subjects, which includes 9.0% who had failed prior biologic DMARD treatment.

Clinical Response in Subjects with Psoriatic Arthritis

The percent of subjects achieving ACR 20, 50 and 70 responses in Trials PsA-1, PsA-2, and PsA-3 are presented in Table 6 below. OTEZLA ± DMARDs, compared with Placebo ± DMARDs resulted in a greater improvement in signs and symptoms of psoriatic arthritis as demonstrated by the proportion of subjects with an ACR 20 response at Week 16.

Table 6. Proportion of Adult Subjects With Active Psoriatic Arthritis With ACR Responses in Trials PsA-1, PsA-2 and PsA-3

	PsA-1		PsA-2		PsA-3	
	Placebo ± DMARDs	OTEZLA 30 mg twice daily ± DMARDs	Placebo ± DMARDs	OTEZLA 30 mg twice daily ± DMARDs	Placebo ± DMARDs	OTEZLA 30 mg twice daily ± DMARDs
N ^a	N = 168	N = 168	N = 159	N = 162	N = 169	N = 167
<u>ACR 20</u> Week 16	19%	38% ^b	19%	32% ^b	18%	41% ^b
<u>ACR 50</u> Week 16	6%	16%	5%	11%	8%	15%
<u>ACR 70</u> Week 16	1%	4%	1%	1%	2%	4%

^a N is number of randomized and treated subjects.

^b Statistically significantly different from placebo (p < 0.05).

OTEZLA 30 mg twice daily resulted in improvement for each ACR component, compared to placebo at Week 16 in Trial PsA-1 (Table 7). Consistent results were observed in Trials PsA-2 and PsA-3.

Table 7. ACR Components Mean Change from Baseline at Week 16 in Trial PsA-1

^a Scale 0-78.

^b Scale 0-76.

^c VAS = Visual Analog Scale; 0 = best, 100 = worst.

^d HAQ-DI = Health Assessment Questionnaire – Disability Index; 0 = best, 3 = worst; measures the subject's ability to perform the following: dress/groom, arise, eat, walk, reach, grip, maintain hygiene, and maintain daily activity.

^e CRP = C-reactive protein; Reference range 00.5 mg/dL.

* N reflects randomized subjects; actual number of subjects evaluable for each endpoint may vary by timepoint.

Treatment with OTEZLA resulted in improvement in dactylitis and enthesitis in subjects with pre-existing dactylitis or enthesitis.

Physical Function Response

OTEZLA 30 mg twice daily demonstrated a greater improvement compared to placebo in mean change from baseline for the Health Assessment Questionnaire Disability Index (HAQDI) score at Week 16 [0.244 vs. 0.086, respectively; 95% CI for the difference was (0.26, 0.06)] in Trial PsA1. The proportions of HAQDI responders (≥ 0.3 improvement from baseline) at Week 16 for the OTEZLA 30 mg twice daily group were 38%, compared to 27%, for the placebo group in Trial PsA1. Consistent results were observed in Trials PsA2 and PsA3.

14.2 Adult Moderate to Severe Plaque Psoriasis

Two multicenter, randomized, double-blind, placebo-controlled trials (PSOR-1 [NCT01194219] and PSOR-2 [NCT01232283]) enrolled a total of 1257 subjects 18 years of age and older with moderate to severe plaque psoriasis [body surface area (BSA) involvement of $\geq 10\%$, static Physician Global Assessment (sPGA) of ≥ 3 (moderate or severe disease), Psoriasis Area and Severity Index (PASI) score ≥ 12 , candidates for phototherapy or systemic therapy]. Subjects were allowed to use low potency topical corticosteroids on the face, axilla and groin. Subjects with plaque psoriasis of the scalp were allowed to use coal tar shampoo and/or salicylic acid scalp preparations on scalp lesions.

Trial PSOR-1 enrolled 844 subjects and Trial PSOR-2 enrolled 413 subjects. In both trials, subjects were randomized 2:1 to OTEZLA 30 mg twice daily (BID) or placebo for 16 weeks. Both trials assessed the proportion of subjects who achieved PASI-75 at Week 16 and the proportion of subjects who achieved an sPGA score of clear (0) or almost clear (1) at Week 16. Across both trials, subjects ranged in age from 18 to 83 years, with an overall median age of 46 years. The mean baseline BSA involvement was 25.2% (median 21.0%), the mean baseline PASI score was 19.1 (median 16.8), and the proportion of subjects with an sPGA score of 3 (moderate) and 4 (severe) at baseline were 70.0% and 29.8%, respectively. Approximately 30% of all subjects had received prior phototherapy and 54% had received prior conventional systemic and/or biologic therapy for the treatment of psoriasis with 37% receiving prior conventional systemic therapy and 30% receiving prior biologic therapy. Approximately one-third of subjects had not received prior phototherapy, conventional systemic nor biologic therapy. A total of 18% of subjects had a history of psoriatic arthritis.

Clinical Response in Adult Subjects with Moderate to Severe Plaque Psoriasis

The proportion of subjects who achieved PASI-75 responses, and an sPGA score of clear (0) or almost clear (1), are presented in Table 8.

Table 8. Clinical Response at Week 16 in Adults with Moderate to Severe Plaque Psoriasis in Trials PSOR-1 and PSOR-2

	Trial PSOR-1		Trial PSOR-2	
	Placebo	OTEZLA 30 mg BID	Placebo	OTEZLA 30 mg BID ^d
N^a	N = 282	N = 562	N = 137	N = 274
PASI^b -75, n (%)	15 (5.3)	186 (33.1)	8 (5.8)	79 (28.8)
sPGA^c of Clear or Almost Clear, n (%)	11 (3.9)	122 (21.7)	6 (4.4)	56 (20.4)

^a N is number of randomized and treated subjects.

^b PASI = Psoriasis Area and Severity Index.

^c sPGA = Static Physician Global Assessment.

^d BID = twice daily.

The median time to loss of PASI-75 response among the subjects re-randomized to placebo at Week 32 during the Randomized Treatment Withdrawal Phase was 5.1 weeks.

Plaque Psoriasis Involving the Scalp Area

A randomized, double-blind, placebo-controlled trial (PSOR-3 [NCT03123471]) was conducted in 303 adult subjects with moderate to severe plaque psoriasis of the scalp. Enrolled subjects had a Scalp Physician Global Assessment (ScPGA) score of ≥ 3 , Scalp Surface Area (SSA) involvement of $\geq 20\%$, an inadequate response or intolerance to at least one topical therapy for plaque psoriasis of the scalp, and moderate to severe plaque psoriasis (BSA involvement of $\geq 10\%$, sPGA of ≥ 3 [moderate or severe disease], and PASI score ≥ 12).

Subjects were randomized 2:1 to receive either OTEZLA 30 mg twice daily (n = 201) or placebo twice daily (n = 102) for 16 weeks. The primary endpoint was the proportion of subjects who achieved an ScPGA response at Week 16 (defined as ScPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline at Week 16). Secondary endpoints included the proportion of subjects with Whole Body Itch Numeric Rating Scale (NRS) response (defined as ≥ 4 -point reduction from baseline) and the proportion of subjects with a Scalp Itch NRS response (defined as ≥ 4 -point reduction from baseline).

Subjects had a mean age of 46.9 years, 61.7% were men and 75.6% were white. At baseline, 76.9% of subjects had moderate plaque psoriasis of the scalp (ScPGA of 3), 23.1% had severe plaque psoriasis of the scalp (ScPGA of 4), 71.6% of subjects were biologic-naïve, and 58.8% had failed 1 or 2 topical treatments. At baseline, the mean Whole Body Itch NRS score was 7.2 and the mean Scalp Itch NRS score was 6.7 with the scales ranging from 0 to 10. The mean baseline SSA involvement was 60.6% and the mean baseline BSA involvement was 19.8%.

The proportion of subjects who achieved an ScPGA response, Whole Body Itch NRS response, and Scalp Itch NRS response at Week 16 are presented in Table 9.

Figure 1 displays the proportion of subjects achieving Whole Body Itch NRS response at each visit, while Figure 2 displays the proportion of subjects achieving Scalp Itch NRS response at each visit.

Table 9. Efficacy Results at Week 16 in Adults with Plaque Psoriasis of the Scalp in Trial PSOR-3

	Trial PSOR-3		
	Placebo	OTEZLA 30 mg twice daily	Treatment Difference ^{a,b} (95% CI ^c)
Number of subjects randomized	N = 102	N = 201	
ScPGA response ^d	13.7%	43.3%	29.6% (19.5%, 39.7%)
Number of subjects with baseline Whole Body Itch NRS Score ≥ 4	N = 94	N = 185	
Whole Body Itch NRS response	22.5%	45.5%	23.0% (11.5%, 34.6%)
Number of subjects with baseline Scalp Itch NRS Score ≥ 4	N = 90	N = 175	
Scalp Itch NRS response	21.1%	47.1%	26.2% (13.9%, 38.5%)

- ^a OTEZLA – Placebo.
- ^b Adjusted difference in proportions is the weighted average of the treatment differences across baseline ScPGA scores with the Cochran-Mantel-Haenszel weights.
- ^c CI = confidence interval.
- ^d ScPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline.

Figure 1. Proportion ($\pm$ SE) of Subjects Achieving Whole Body Itch NRS Response through Week 16

NRS = Numeric Rating Scale; SE = standard error

NRS = Numeric Rating Scale; SE = standard error

Plaque Psoriasis Involving the Genital Area

A randomized, double-blind, placebo-controlled trial (PSOR-5 [NCT03777436]) was conducted in 289 adult subjects with moderate to severe plaque psoriasis of the genital area. Subjects had a modified static

Physician Global Assessment of Genitalia (sPGA-G) score of ≥ 3 (moderate or severe), sPGA score of ≥ 3 (moderate or severe), and had an inadequate response or were intolerant to topical therapy for the treatment of plaque psoriasis of the genital area.

Subjects were randomized 1:1 to receive either apremilast 30 mg twice daily (n = 143) or placebo twice daily (n = 146) for 16 weeks. At Week 16, the placebo group was switched to receive OTEZLA and the OTEZLA group remained on drug through Week 32. The primary endpoint was the proportion of subjects who achieved a modified sPGA-G response (defined as a score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline) at Week 16. Secondary endpoints included the proportion of subjects who achieved an sPGA response (defined as a score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline) at Week 16 and the proportion of subjects who achieved at least a 4-point improvement in the 11-point Genital Psoriasis Itch Numeric Rating Scale (GPI-NRS) item score within the Genital Psoriasis Symptoms Scale (GPSS) at Week 16, among subjects with a baseline GPI-NRS score of ≥ 4 .

Subjects ranged in age from 18-81 years, with a median age of 44 years. The proportions of subjects with a modified sPGA-G score of 3 (moderate) and 4 (severe) at baseline were 86.9% and 13.1%, respectively. The proportions of subjects with a sPGA score of 3 (moderate) and 4 (severe) at baseline were 88.6% and 11.1%, respectively. Baseline BSA involvement was $< 10\%$ for 57.4% of the subjects and $\geq 10\%$ for 42.6% of the subjects. The mean baseline GPI-NRS score was 6.5. Of the enrolled subjects, 78.9% did not receive prior conventional systemic therapy and 84.4% were biologic-naïve.

The proportions of subjects who achieved a modified sPGA-G response, sPGA response, and GPI-NRS response are presented in Table 10.

Table 10. Efficacy Results at Week 16 in Adults with Plaque Psoriasis of the Genital Area in Trial PSOR-5

	Trial PSOR-5		
	Placebo	OTEZLA 30 mg twice daily	Treatment Difference ^{a,b} (95% CI) ^c
Number of Subjects Randomized	N = 146	N = 143	
Modified sPGA-G Response ^d	19.5%	39.6%	20.1% (9.2%, 30.9%)
sPGA Response ^e	6.9%	22.2%	15.2% (6.9%, 23.6%)
Number of Subjects with Baseline GPI-NRS Score ≥ 4	N = 121	N = 122	
GPI-NRS Response ^f	19.6%	47.3%	27.4% (15.4%, 39.3%)

^a OTEZLA – Placebo.

^b Adjusted difference in proportions is the weighted average of the treatment differences across the baseline BSA strata (BSA $< 10\%$ or $\geq 10\%$) with the Cochran-Mantel-Haenszel weights.

^c CI = confidence interval.

^d Modified sPGA-G score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline. The sPGA-G scale was modified from a 6-point to a 5-point scale, ranging from 0 (clear) to 4 (severe), to assess the severity of the 3 primary signs of genital psoriasis: erythema, scaling, and plaque elevation.

^e sPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline.

^f GPI-NRS score reduction of ≥ 4 -points from baseline.

14.3 Pediatric Moderate to Severe Plaque Psoriasis

A multicenter, randomized, double-blind, placebo-controlled trial (PSOR-6 [NCT03701763]) was conducted in 245 pediatric subjects 6 to 17 years of age (inclusive) with moderate to severe plaque psoriasis who were candidates for phototherapy or systemic therapy. Subjects had an sPGA score of ≥ 3 (moderate or severe disease), BSA involvement of $\geq 10\%$, and PASI score of ≥ 12 , with psoriasis that was inadequately controlled by or inappropriate for topical therapy. Subjects were allowed to use low potency or weak topical corticosteroids on the face, axilla, and groin and unmedicated skin moisturizers for body lesions only.

Subjects were randomized 2:1 to receive either OTEZLA (n = 163) or placebo (n = 82) for 16 weeks. Subjects with a baseline weight of 20 kg to < 50 kg received OTEZLA 20 mg twice daily or placebo twice daily, and subjects with a baseline weight ≥ 50 kg received OTEZLA 30 mg twice daily or placebo twice daily. At Week 16, the placebo group was switched to receive OTEZLA (with dosage based on baseline weight) and the OTEZLA group remained on drug (according to their original dosing assignment) through Week 52. The primary endpoint was the proportion of subjects who achieved an sPGA response (defined as a score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline) at Week 16. The key secondary endpoint was the proportion of subjects who achieved a PASI-75 response (at least a 75% reduction in PASI score from baseline) at Week 16.

Enrolled subjects ranged in age from 6 to 17 years, with a median age of 13 years; 41.2% of subjects were 6 to 11 years of age and 58.8% of subjects were 12 to 17 years of age. Of the enrolled subjects, 52.2% were female. For race, 86.9% were White, 3.7% were Asian, 3.3% were Black or African American, 0.8% were American Indian or Alaskan Native, and 5.3% were not reported or unknown. For ethnicity, 81.6% of subjects identified as not Hispanic or Latino, 13.1% identified as Hispanic or Latino, and 5.3% were not reported or unknown. The mean baseline BSA involvement was 31.5% (median 26.0%), the mean baseline PASI score was 19.8 (median 17.2), and the proportions of subjects with an sPGA score of 3 (moderate) and 4 (severe) at baseline were 75.5% and 24.5%, respectively. Of the enrolled subjects, 82.9% did not receive prior conventional systemic therapy and 94.3% were biologic-naïve.

Clinical Response in Pediatric Subjects 6 to 17 Years of Age and Weighing at Least 20 kg with Moderate to Severe Plaque Psoriasis

The proportions of subjects who achieved sPGA response and PASI-75 response at Week 16 are presented in Table 11.

Table 11. Efficacy Results at Week 16 in Pediatric Subjects 6 to 17 Years of Age and Weighing at Least 20 kg with Moderate to Severe Plaque Psoriasis in Trial PSOR-6

	Trial PSOR-6		
	Placebo	OTEZLA ^a	Treatment Difference ^{b,c} (95% CI) ^d
Number of Subjects Randomized	N = 82	N = 163	
sPGA Response ^e	10.8%	33.1%	22.3% (12.2%, 32.4%)
PASI-75 Response ^f	16.0%	45.7%	29.7%

			(17.9%, 41.6%)
--	--	--	----------------

- ^a Subjects weighing ≥ 50 kg received OTEZLA 30 mg twice daily and subjects weighing 20 kg to < 50 kg received OTEZLA 20 mg twice daily.
- ^b OTEZLA – Placebo.
- ^c Adjusted difference in proportions is the weighted average of the treatment differences across the baseline age strata (6 to 11 years of age or 12 to 17 years of age) with the Cochran-Mantel-Haenszel weights.
- ^d CI = confidence interval.
- ^e sPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline.
- ^f At least a 75% reduction in PASI score from baseline.

14.4 Adult Mild to Moderate Plaque Psoriasis

A multicenter, randomized, double-blind, placebo-controlled trial (PSOR-4 [NCT03721172]) was conducted in 595 adult subjects with mild to moderate plaque psoriasis (BSA involvement of 2-15%, sPGA score of 2-3 [mild or moderate disease], and PASI score of 2-15). Enrolled subjects had an inadequate response or were intolerant to at least one topical therapy and had not received prior biologic therapy. Subjects were allowed to use unmedicated emollients for lesions on non-scalp areas of the body and non-medicated shampoos for lesions on the scalp.

Subjects were randomized 1:1 to receive either OTEZLA 30 mg twice daily (n = 297) or placebo twice daily (n = 298) for 16 weeks. At Week 16, the placebo group was switched to receive OTEZLA and the OTEZLA group remained on drug through Week 32. The primary endpoint was the proportion of subjects who achieved an sPGA response (defined as an sPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline) at Week 16. Subjects with mild disease (sPGA = 2 at baseline) were required to be clear (sPGA = 0) to achieve an sPGA response. Other evaluated endpoints include the proportion of subjects with a Whole Body Itch NRS response (defined as a ≥ 4 -point reduction from baseline) at Week 16 among subjects with a baseline Whole Body Itch NRS ≥ 4 and the proportion of subjects with an ScPGA response (defined as an ScPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline) at Week 16 among subjects with a baseline ScPGA score ≥ 2 .

Subjects ranged in age from 18 to 85 years, with an overall median age of 50 years. The mean baseline BSA involvement was 6.4%, the mean baseline PASI score was 6.5, and the proportions of subjects with an sPGA score of 2 (mild) and 3 (moderate) at baseline were 30.6% and 69.4%, respectively.

Clinical Response in Subjects with Mild to Moderate Plaque Psoriasis

The proportions of subjects who achieved an sPGA response, Whole Body Itch NRS response, and an ScPGA response at Week 16 are presented in Table 12.

Table 12. Efficacy Results at Week 16 in Adults with Mild to Moderate Plaque Psoriasis in Trial PSOR-4

	Trial PSOR-4		
	Placebo	OTEZLA 30 mg twice daily	Treatment Difference ^{a,b} (95% CI ^c)
Number of Subjects Randomized	N = 298	N = 297	
sPGA Response ^d	4.1%	21.6%	17.5% (12.2%, 22.8%)

Number of Subjects with Baseline Whole Body Itch NRS Score ≥ 4	N = 249	N = 253	
Whole Body Itch NRS Response ^c	18.6%	43.2%	24.7% (16.5%, 32.8%)
Number of Subjects with Baseline ScPGA Score ≥ 2	N = 199	N = 212	
ScPGA Response ^f	16.6%	44.0%	27.4% (18.6%, 36.3%)

^a OTEZLA – Placebo.

^b Adjusted difference in proportions is the weighted average of the treatment differences across baseline sPGA scores with the Cochran-Mantel-Haenszel weights.

^c CI = confidence interval.

^d sPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline.

^e Whole Body Itch NRS score reduction of ≥ 4 -points from baseline.

^f ScPGA score of clear [0] or almost clear [1] with at least a 2-point reduction from baseline.

14.5 Adult Oral Ulcers Associated with Behçet's Disease

A multicenter, randomized, placebo-controlled trial (BCT-002 [NCT02307513]) enrolled a total of 207 adult subjects with BD with active oral ulcers. Subjects were previously treated with at least one nonbiologic BD medication and were candidates for systemic therapy. Subjects met the International Study Group (ISG) Criteria for BD. Subjects had at least 2 oral ulcers at screening and at least 2 oral ulcers at randomization and without currently active major organ involvement. Concomitant treatment for BD was not allowed.

Subjects were randomized 1:1 to receive either OTEZLA 30 mg twice daily (n = 104) or placebo (n = 103) for 12 weeks. After Week 12, all subjects received OTEZLA 30 mg twice daily.

Efficacy was assessed based on the number and pain of oral ulcers.

Subjects ranged in age from 19 to 72 years, with a mean age of 40 years. The mean duration of BD was 6.84 years. All subjects had a history of recurrent oral ulcers that were currently active. Subjects had a history of skin lesions (98.6%), genital ulcers (90.3%), musculoskeletal manifestations (72.5%), ocular manifestations (17.4%), central nervous system (9.7%), gastrointestinal (GI) manifestations (9.2%) and vascular involvement (1.4%). The mean baseline oral ulcer counts were 4.2 and 3.9 in the OTEZLA and placebo groups, respectively.

Measures of Oral Ulcers

Improvements in measures of oral ulcers at Week 12 are presented in Table 13.

Table 13. Clinical Response of Oral Ulcers at Week 12 in Adult Subjects with BD in the BCT-002 Trial (ITT^a Population)

Endpoint	Placebo N = 103	OTEZLA 30 mg twice daily N = 104	Treatment Difference^b (95% CI^c)
Change ^d from baseline in the pain of oral ulcers as measured by VAS ^e at Week 12	-18.7	-42.7	-24.1 (-32.4, -15.7)

Endpoint	Placebo N = 103	OTEZLA 30 mg twice daily N = 104	Treatment Difference ^b (95% CI ^c)
Proportion ^f of subjects achieving oral ulcer complete response (oral ulcer-free) at Week 12	22.3%	52.9%	30.6% ^g (18.1%, 43.1%)
Proportion ^f of subjects achieving oral ulcer complete response (oral ulcer-free) by Week 6, and who remained oral ulcer-free for at least 6 additional weeks during the 12-week Placebo-controlled Treatment Phase	4.9%	29.8%	25.1% ^g (15.5%, 34.6%)
Daily average ^{h,i} number of oral ulcers during the 12-week Placebo-controlled Treatment Phase	2.6	1.5	-1.1 (-1.6, -0.7)

^a ITT = intent to treat.

^b OTEZLA – Placebo.

^c CI = confidence interval.

^d Mean changes from baseline are least square means from mixed effects-model for repeated measures, adjusting for sex, region, and baseline pain of oral ulcers as measured by the visual analog scale.

^e VAS = visual analog scale; 0 = no pain, 100 = worst possible pain.

^f Subjects for whom data are not available to determine response status are considered non-responders.

^g Adjusted difference in proportions is the weighted average of the treatment differences across the 4 strata of combined sex and region factors with the Cochran-Mantel-Haenszel weights.

^h Mean daily averages are least squares means from analysis of covariance, after adjusting for sex, region, and baseline number of oral ulcers.

ⁱ Based on oral ulcer counts measured at baseline and at Weeks 1, 2, 4, 6, 8, 10, and 12.

Figure 3 displays the mean number of oral ulcers for each treatment group at each visit, while Figure 4 displays the mean oral ulcer pain on a visual analog scale for each treatment group at each visit.

Figure 1. Mean ($\pm$ SE) Number of Oral Ulcers by Time Point Through Week 12 (ITT Population)

Weeks	0	1	2	4	6	8	10	12
Placebo, n	103	98	97	93	91	86	83	82
OTEZLA 30 mg twice daily, n	104	101	101	101	98	94	94	97

ITT = intent-to-treat; SE = standard error

Figure 2. Mean ($\pm$ SE) Oral Ulcer Pain on a Visual Analog Scale by Time Point Through Week 12 (ITT Population)

Weeks	0	1	2	4	6	8	10	12
Placebo, n	101	95	96	91	90	85	82	81
OTEZLA 30 mg twice daily, n	102	95	97	99	97	92	93	95

ITT = intent to treat; SE = standard error.

Oral ulcer pain was assessed on a 100-mm Visual Analog Scale with 0 = no pain and 100 = worst possible pain. Mean baseline Visual Analog Scale pain scores were 61.2 and 60.8 in the OTEZLA 30 mg twice daily treatment group and placebo treatment group, respectively.

16 HOW SUPPLIED/STORAGE AND HANDLING

OTEZLA is available as diamond-shaped, film-coated tablets in the following dosage strengths: 10 mg pink tablet engraved with “APR” on one side and “10” on the other side; 20 mg brown tablet engraved with “APR” on one side and “20” on the other side; 30 mg beige tablet engraved with “APR” on one side and “30” on the other side.

Tablets are supplied in the strengths and package configurations listed in Table 14.

Table 14. OTEZLA Package Configurations

Package configuration	Tablet strength	NDC number
Configurations for 30 mg BID Dosage		
28-day treatment initiation pack	55-tablet blister pack including tablets for titration and maintenance dosage: 4 tablets (10 mg each), 4 tablets	55513-369-55

Package configuration	Tablet strength	NDC number
	(20 mg each), and 47 tablets (30 mg each)	
60-count bottle	30 mg	55513-137-60
Configurations for 20 mg BID Dosage		
28-day treatment initiation pack	55-tablet blister pack including tablets for titration and maintenance dosage: 4 tablets (10 mg each) and 51 tablets (20 mg each)	55513-508-55
60-count bottle	20 mg	55513-497-60

OTEZLA XR is available as 75 mg round, biconvex, pink, film-coated extended-release tablets with “APR 75” printed in black on one side and a hole or indentation on either side of the tablet, which may or may not be visible.

Tablets are supplied in the strengths and package configurations listed in Table 15.

Table 15. OTEZLA XR Package Configurations

Package configuration	Tablet strength	NDC number
28-day treatment initiation pack	41-tablet blister titration pack including tablets for titration and maintenance dosage: OTEZLA: 4 tablets (10 mg each), 4 tablets (20 mg each), and 19 tablets (30 mg each) and OTEZLA XR: 14 tablets (75 mg each)	55513-516-41
Bottles of 30	OTEZLA XR: 30 tablets (75 mg each)	55513-519-30

Storage and Handling

Store OTEZLA tablets below 30°C (86°F).

Store OTEZLA XR tablets between 20°C and 25°C (68°F and 77°F); excursions permitted between 15°C and 30°C (59°F and 86°F) [see USP Controlled Room Temperature].

17 PATIENT COUNSELING INFORMATION

- *Administration Instructions*

Instruct patients to take OTEZLA/OTEZLA XR only as prescribed [see *Dosage and Administration* (2.1 and 2.3)]. Advise patients to take OTEZLA/OTEZLA XR with or without food. Instruct patients to swallow tablets whole and not to crush, split, or chew prior to swallowing [see *Dosage and Administration* (2.4)].

- *Hypersensitivity*
Inform patients that hypersensitivity reactions can occur following administration of OTEZLA/OTEZLA XR. Instruct patients to contact their healthcare provider if they experience symptoms of an allergic reaction [see *Warnings and Precautions* (5.1)].
- *Diarrhea, Nausea, and Vomiting*
Advise patients of the potential complications of severe diarrhea, nausea, or vomiting and instruct them to contact their healthcare provider if they experience these adverse reactions, especially if the patient is 65 years of age or older [see *Warnings and Precautions* (5.2)].
- *Depression*
Inform patients that treatment with OTEZLA/OTEZLA XR is associated with an increased incidence of depression. Advise patients, their caregivers, and families of the need to be alert for the emergence or worsening of depression, suicidal thoughts or other mood changes, and if such changes occur to contact their healthcare provider [see *Warnings and Precautions* (5.3)].
- *Weight Decrease*
Inform patients that treatment with OTEZLA/OTEZLA XR is associated with potential weight loss. Instruct patients or caregivers to have their or their child's weight monitored regularly and, if unexplained or clinically significant weight loss occurs, to contact their healthcare provider for evaluation of the weight loss [see *Warnings and Precautions* (5.4)].
- *Pregnancy*
Advise pregnant patients and patients of reproductive potential of the potential risk to a fetus. Advise patients to inform their prescriber of a known or suspected pregnancy [see *Use in Specific Populations* (8.1)].
- *Residual Tablet Shell*
Patients receiving OTEZLA XR may notice an inert tablet shell passing in the stool or via colostomy. Patients should be informed that the active medication has already been absorbed by the time the patient sees the inert tablet shell.
