

CENTER FOR DRUG EVALUATION AND RESEARCH

APPLICATION NUMBER: NDA 19834/S002

MEDICAL REVIEW(S)

NOV 29 1993

1 Title and General Information

- 1.1 **Medical Officer's Review**
 - 1.1.1 **NDA #** 19-834/5-002
 - 1.1.2 **M.O. Review #**
 - 1.1.3 **Submission**
 - 1.1.4 **Review completed**

- 1.2 **Drug name**
 - 1.2.1 **Generic name:** Felodipine
 - 1.2.2 **Proposed trade name:** Plendil
 - 1.2.3 **Chemical Structure**

- 1.3 **Sponsor:** Merck Sharp and Dohme
- 1.4 **Pharmacologic Category** calcium channel blocker
- 1.5 **Proposed Indication** Hypertension
- 1.6 **Dosage Form and Route of Administration** 2.5mg extended release tablet
- 1.7 **NDA Drug Classification** Type 5 new strength of marketed drug
- 1.8 **Important Related Drugs** Felodipine is one of many dihydropyridines of which nifedipine is the prototype.

ABBREVIATIONS(ABBR): ANOVA, analysis of variance; APP, appendix; AUC, area under the curve; BA, Bioavailability; BP Blood pressure; ca, circa; CA, California; Ca, calcium; CA cancer; CI, confidence interval; C_{max} maximum concentration; C_{min}, minimum concentration; CR, controlled release; DB, double blind; DFL, degree of fluctuation; (F), fasting; GITS, gastrointestinal therapeutic system; GP, group; GTN, glyceryl trinitrate; IR, immediate release; Kgh, kilogram hour; MR, modified release; (NF), non fasting; OL, open label; OROS, oral osmotic; PBO, placebo; PLL, parallel; RD, randomized; SEC, soft elastic capsule; SR, sustained release; T_{max}, time to maximum concentration.

3 Material Reviewed The evidence supporting the bioequivalence of 2.5mg and the approved 5.0mg ER felodipine tablets is presented in a single volume. The question of approvability rests on the data from a single pharmacokinetic study. Other studies included with this submission for ease of reference require no review. Two studies (protocols 003 and 006) from the original NDA are re-examined in support of the evidence of bioequivalence of two 2.5mg and one 5.0mg tablet.

4 Chemistry/Manufacturing Controls There has been a minor change (namely in the quantities of excipients) in the formulation of the 2.5mg tablet since the approval of felodipine ER for the treatment of hypertension. The desired extended release of the drug is achieved by finding the optimal mixture of solubilizing agent, binder, lubricant, filler, and felodipine. The 2.5 and 5.0mg tablets vary only by the amount of drug and solubilizing agent. See Chem review for details.

The detailed mechanism of release of the drug from the hydrophilic and hydrophobic components of the gel forming tablet is not completely understood. The coating of the 2.5mg tablet differs ever so slightly from the other tablets. Pharmacokinetic data are necessary in order to determine what effect this subtle difference has on bioavailability of the drug. Please see bipoharm. review by Dr Patrick Marroum.

Animal Pharmacology/Toxicology NA

6 Clinical Background

6.1 Relevant human experience Safety and efficacy of the drug are not in question.

6.2 Important information from related INDs and NDAs Study # 006/16(Hassle protocol 6) demonstrated the superiority of 2.5mg felodipine SR to placebo. A total of 286 patients were enrolled at 16 centers.

Patients were randomized to the four groups to receive PBO, 2.5mg, 5.0mg, or 10mg tablets. Distribution of patients and the demographics and disposition are tabulated on the following two pages.

Number of Patients Entered by Investigator
(Protocol 6)

| Study No. | Investigator | Placebo | Felodipine ER | | | Total |

These data demonstrate an effect of the 2.5 mg dose on blood pressure. See Statistical Review NDA 19-834 Vol.1.1A.

6.3 Foreign experience NA

6.4 Human Pharmacology

6.4.1 Pharmacokinetics The pharmacokinetic data of interest are the bioequivalence of the 1.25 and 2.5mg, the 2.5 and 5mg ER tablets. Plasma levels necessary to establish a dose proportionality for the 2.5 mg dose are lacking. It is not therefor feasible to apply the hyperbolic curve fitting model as for the 10mg dose. The curve derived from the relationship

$$E = \frac{E_{max}(C-C_{min})}{EC50+(C-C_{min})}$$

is taken from biopharm review by Dr.Teng.

For the 2.5mg dose this curve would be shifted far to the left and the value of E close to zero. Extrapolation from values for the 10 mg dose assuming linearity of dose proportionality is not permissible. This model does little to support the case for the 2.5mg sustained release tablet.

6.4.2 Pharmacodynamics

Study 003/16 was a dose response study of 1.25, 2.5, 5.0 and 10mg bid felodipine in mild to moderate hypertension. All doses beat placebo, and reduction in DBP increased *pari passu* with dose. The response to the 1.25 mg dose was most impressive in elderly with mild hypertension.

In a third study the 2.5 mg dose did not beat placebo and there was no difference between the effects of the 5.0 and 10.0 mg bid doses on trough or peak diastolic blood pressures. Moreover in this study the t/p was <1/2 for the 5.0 and 10.0 mg bid doses.

7 Description of Clinical Data Sources NA

8 Clinical Studies

8.1 Trial # V-014 A comparative study on the relative bioavailability of 2.5 and 5.0 mmg felodipine tablets.

8.1.1 Objective: Evaluation of the 2.5mg formulation at steady state with reference to the 5.0mg tablet.

8.1.2 Design The study was a two way crossover randomized comparison of two (2) 2.5mg tablets with one(1) 5mg tablet at steady state. The crossover design is displayed in the diagram.

¹ Days 6 and 14: 24-hour sample 8 a.m. (trough II) + felodipine dose at the lab

² Days 7 and 15: 24-hour sample 8 a.m. (trough III) + felodipine dose at the lab + full sampling day (0-14h): cont. on days 8 and 16 with 24-hour samples (trough III)
wash-out period of 1 week

8.1.3 Protocol

8.1.3.1 Population, procedures Twenty healthy men aged 20-24 years selected according to the inclusion and exclusion are as given in the original NDA. The subjects were evaluated by medical history, physical examination, laboratory test and ecg, and all were considered to be healthy. Their physical characteristics are summarized in the table.

Individual subject data at the time of the pretreatment period and the treatment sequence during the study, n=20

| Subject | Age (years) | Weight (kg) | Height (cm) | Supine | | | Standing | | | Treatment sequence* |
|---------|-------------|-------------|-------------|------------|------------|----------------|------------|------------|----------------|---------------------|

| SD: | 3 | 6.2 | 6.7 | 9 | 7 | 14 | 10 | 7 | 14 | |
| Min: | | | | | | | | | | |
| Max: | | | | | | | | | | |

* 1 = 2x2.5 mg
2 = 1x5 mg

Indwelling catheters were inserted in antecubital vein of each subject for blood sampling on days 6, 7, 14, and 15 of the study at intervals of 0.5, 1.5, 2, 3, 4, 5, 6, 7, 8, 10, 12, 14, and 24 hours after medication.

8.1.3.2 Endpoints: The pharmacokinetic measurements C_{min} , C_{max} , T_{max} , and AUC for the two formulations at steady state.

8.1.3.3 Statistical considerations

Peak and trough C_{max} C_m , t_{max} were determined for each subject were treated (except for t_{max}) by parametric analysis. Proper attention was given to period and carryover effects.

8.1.4 Results The pharmacokinetics of the two formulations is graphically displayed in the curve.

Except for a slight difference in C_{max} the two curves are superimposable. The pharmacokinetic data for the two formulations, 2.5x2 and 5mg tablet are summarized tabular form on the next page.

Felodipine C_{max}(nmol/L), C_{min}(nmol/L), AUC(nmol·h/L),
t_{max}(h) and frel(%), n=20

8.1.4.2 Efficacy endpoint outcomes *Vide supra*

8.1.4.3 Safety-comparisons NA

9 Overview of Efficacy NA

10 Overview of Safety

Safety was monitored by physical examination, ecg, and standard laboratory tests. There was no evidence of disease on physical examination in any subject and no ecg abnormalities. Transient elevations of S-ASAT and S-ALAT in one subject.

10.1 Significant/Potentially Significant Events

10.1.1 Deaths There were no deaths

10.1.2 Other Significant/Potentially Significant Events

There were no serious or unexpected ADRs. ADRs are summarized in the tables.

No. of individuals with the most common adverse experiences.

| Symptom | 2x2.5 mg | 1x5 mg |
|---|-----------------|---------------|
| Headache | 7 | 13 |
| Flush | 2 | - |
| increased diuretics | - | 2 |
| Total No. of individuals with AE's | 13 | 16 |

10.2 Other Safety Findings NA

11 Labeling Review See original NDA. Items in labeling listed below need no modification save for inclusion of the 2.5mg dose.

- 11.8 Drug Abuse and Dependence**
- 11.9 Overdosage**
- 11.10 Dosage and Administration**
- 11.11 How Supplied**

12 Conclusions

Equivalance of the 2.5mg and 5mg tablets by in vitro measurements appears well established. The conclusion that the 2.5mg ER tablet is an acceptable formulation rests on two clinical studies and evidence that the 2.5 and 5.0mg tablets ar bioequivalent. The two studies reviewed (003 and 006) showed this dose to be superior to placebo. The case is weakened by another study in which none of the doses appeared effective. In the original submission it was concluded that 5.0mg was the most reasonable starting dose, studies 003 and 006 not withstanding. This conclusion is probably correct where mean values are the criteria of efficacy, but in practical application clinicians would prefer to begin treatment with the lowest possible dose. Since there is some evidence though indirect that 2.5 mg ER tablet is an effective dose, it is desirable to have the dose available. The dose doubtless is ineffective for many patients. However, in some patients e.g. older patients, patients with liver disease, the smaller dose would be particularly desriable.

Page 15 - NDA 19-834

The pharmacokinetic data reviewed demonstrate beyond peradventure of cavil the bioequivalence of two 2.5mg tablets and one 5.0mg tablet.

13 Recommendations Approval is recommended.
