HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use LOPINAVIR AND RITONAVIR ORAL GRANULES safely and effectively. See full prescribing information for LOPINAVIR AND RITONAVIR ORAL GRANULES.

LOPINAVIR and RITONAVIR Oral Granules

---------- INDICATIONS AND USAGE ----------
Lopinavir and Ritonavir Oral Granules is an HIV-1 protease inhibitor indicated in combination with other antiretroviral agents for the treatment of HIV-1 infection in adults and pediatric patients (14 days and older). (1)

---------- DOSAGE AND ADMINISTRATION ----------
Oral granules: must be taken with a meal. (2.1)

Adults (2.2):
- The recommended dosage is 400/100 mg twice daily.

Pediatric Patients (14 days and older) (2.3):
- Twice daily dose is based on body weight.
- Lopinavir and Ritonavir Oral Granules should not be administered to neonates before a postmenstrual age (first day of the mother's last menstrual period to birth plus the time elapsed after birth) of 42 weeks and a postnatal age of at least 14 days has been attained. (2.3)

Concomitant Therapy in Adults:
- Dose adjustments of Lopinavir and Ritonavir Oral Granules may be needed when co-administering with efavirenz, nevirapine, or nelfinavir in adults. (2.2, 2.3, 7.3)

Pregnancy (2.4):
- 400/100 mg twice daily in pregnant patients with no documented lopinavir-associated resistance substitutions.
- There are insufficient data to recommend a Lopinavir and Ritonavir Oral Granules dose for pregnant patients with any documented lopinavir and/or ritonavir-associated resistance substitutions.
- No dose adjustment of Lopinavir and Ritonavir Oral Granules is required for patients during the postpartum period.

---------- DOSAGE FORMS AND STRENGTHS ----------
- Oral granules: 40 mg lopinavir and 10 mg ritonavir (3)

---------- CONTRAINDICATIONS ----------
- Hypersensitivity to Lopinavir and Ritonavir Oral Granules (e.g., toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, urticaria, angioedema) or any of their ingredients, including ritonavir. (4)
- Co-administration with drugs highly dependent on CYP3A for clearance and for which elevated plasma levels may result in serious and/or life-threatening events. (4)
- Co-administration with potent CYP3A inducers where significantly reduced lopinavir plasma concentrations may be associated with the potential for loss of virologic response and possible resistance and cross resistance. (4)

---------- WARNINGS AND PRECAUTIONS ----------
The following have been observed in patients receiving Lopinavir and Ritonavir Oral Granules:
- The concomitant use of Lopinavir and Ritonavir Oral Granules and certain other drugs may result in known or potentially significant drug interactions. Consult the full prescribing information prior to and during treatment for potential drug interactions. (5.1, 7.3)
- Pancreatitis: Fatalities have occurred; suspend therapy as clinically appropriate. (5.3)
- Hepatotoxicity: Fatalities have occurred. Monitor liver function before and during therapy, especially in patients with underlying hepatic disease, including hepatitis B and hepatitis C, or marked transaminase elevations. (5.4, 8.6)
- QT interval prolongation and isolated cases of torsade de pointes have been reported although causality could not be established. Avoid use in patients with congenital long QT syndrome, those with hypokalemia, and with other drugs that prolong the QT interval. (5.1, 5.5, 12.3)
- PR interval prolongation may occur in some patients. Cases of second- and third-degree heart block have been reported. Use with caution in patients with pre-existing conduction system disease, ischemic heart disease, cardiomyopathy, underlying structural heart disease or when administering with other drugs that may prolong the PR interval. (5.1, 5.6, 12.3)
- Patients may develop new onset or exacerbations of diabetes mellitus, hyperglycemia (5.7), immune reconstitution syndrome. (5.8), redistribution/accumulation of body fat. (5.10)
- Total cholesterol and triglycerides elevations. Monitor prior to therapy and periodically thereafter. (5.9)
- Hemophilia: Spontaneous bleeding may occur, and additional factor VIII may be required. (5.11)

---------- ADVERSE REACTIONS ----------
Commonly reported adverse reactions to Lopinavir and Ritonavir Oral Granules included diarrhea, nausea, vomiting, hypertriglyceridemia and hypercholesterolemia. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Mylan at 1-877-446-3679 (1-877-4-INFO-RX) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

---------- DRUG INTERACTIONS ----------
Co-administration of Lopinavir and Ritonavir Oral Granules can alter the plasma concentrations of other drugs and other drugs may alter the plasma concentrations of lopinavir. The potential for drug-drug interactions must be considered prior to and during therapy. (4, 5.1, 7, 12.3)

---------- USE IN SPECIFIC POPULATIONS ----------
Lactation: Breastfeeding not recommended. (8.2)

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

Revised: 8/2018

FULL PRESCRIBING INFORMATION: CONTENTS*

*Sections or subsections omitted from the full prescribing information are not listed.

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

Lopinavir and Ritonavir Oral Granules is indicated in combination with other antiretroviral agents for the treatment of HIV-1 infection in adults and pediatric patients 14 days and older.

Limitations of Use:

- Genotypic or phenotypic testing and/or treatment history should guide the use of Lopinavir and Ritonavir Oral Granules. The number of baseline lopinavir resistance-associated substitutions affects the virologic response to Lopinavir and Ritonavir Oral Granules *[see Microbiology (12.4)]*.

2 DOSAGE AND ADMINISTRATION

2.1 General Administration Recommendations

Lopinavir and Ritonavir Oral Granules must be taken with a meal twice daily. Lopinavir and Ritonavir Oral Granules should be sprinkled/mixed with soft food such as applesauce, or mixed with liquid such as water, as described below. Lopinavir and Ritonavir Oral Granules should not be chewed or crushed.

Instructions for Mixing Lopinavir and Ritonavir Oral Granules

1. Determine the number of sachets needed to prepare a dose.
2. Prior to mixing, tap the sachet(s) to move all the granules to the bottom of the sachet(s).
3. Completely tear or cut off the top of the sachet(s) and make sure the sachet(s) are fully open.
4. Mixing with soft food such as applesauce: Using a spoon, mix the entire contents of the Lopinavir and Ritonavir Oral Granules sachet(s) with soft food (approximately 1 teaspoon of soft food for 1 sachet; 2 teaspoons for 2 sachets, etc.) in a small cup or bowl. Make sure no granules/powder are left inside the sachet(s). Give or take all of the mixture. If any granules are left in the small cup/bowl or spoon, add more soft food to the granules and mix. Then give or take the mixture along with 240 mL (8 oz.) of drinking water, to ensure that no granules are left behind in the mouth.
5. Mixing with liquid such as drinking water: Using a spoon, mix the entire contents of the Lopinavir and Ritonavir Oral Granules sachet(s) with approximately 120 mL (4 oz.) of drinking water in a drinking glass. Make sure no granules/powder are left inside the sachet(s). Give or take all of the mixture. If any granules are left in the drinking glass, add more liquid (water) and mix. Then give or take the mixture.
6. Administer the drug/food mixture within 2 hours of preparation. If not administered within 2 hours of preparation, throw away the mixture and prepare a new dose.
7. Repeat above steps for next dose.

For more details on preparation and administration, see *Instructions for Use*

For infants not yet taking solid food (i.e., less than 6 months of age):

There is currently no experience administering granules to infants less than 3 months. In the youngest infants (3-6 months of age) in the CHAPAS 2 study, oral pellets were added to a small volume of expressed breastmilk in a spoon and given to the infant or administered directly on the infant's tongue prior to breastfeeding.

Since oral granules should not be chewed or crushed prior to administration, it is important to ensure that infants are developmentally able to swallow them.

2.2 Dosage Recommendations in Adults

Table 1 lists the number of sachets containing Lopinavir and Ritonavir Oral Granules 40 mg/10 mg to be administered twice daily in adults.

Table 1. Lopinavir and Ritonavir Oral Granules Daily Dosage Recommendation in Adults

	Number of Sachets Containing Lopinavir and Ritonavir Oral Granules 40 mg/10 mg Needed to Prepare Each Dose
Recommended dosage	10 sachets (400 mg/100 mg) twice daily
Recommended dosage in combination with efavirenz, nevirapine, or nelfinavir	13 sachets (520 mg/130 mg) twice daily

2.3 Dosage Recommendations in Pediatric Patients

Table 2 lists the number of sachets containing Lopinavir and Ritonavir Oral Granules 40 mg/10 mg to be administered twice daily to pediatric patients 14 days to less than 18 years of age.

- Lopinavir and Ritonavir Oral Granules should not be administered to premature neonates (born one month or more before expected date of delivery) until 14 days after their due date *[see Warnings and Precautions (5.2)]*.
- Lopinavir and Ritonavir Oral Granules should not be administered once daily to pediatric patients less than 18 years of age.
- Total dose of Lopinavir and Ritonavir Oral Granules in pediatric patients should not exceed the recommended adult daily dose of 400/100 mg twice daily.

Table 2. Lopinavir and Ritonavir Oral Granules Daily Dosage Recommendations in Pediatric Patients 14 Days to Less Than 18 Years of Age

Weight Band	**Number of Sachets Containing Lopinavir and Ritonavir Oral Granules 40 mg/10 mg Needed to Prepare Each Dose**[1]
3 kg to less than 6 kg	2 sachets (80 mg/20 mg) twice daily
6 kg to less than 10 kg	3 sachets (120 mg/30 mg) twice daily
10 kg to less than 14 kg	4 sachets (160 mg/40 mg) twice daily
14 kg to less than 20 kg	5 sachets (200 mg/50 mg) twice daily
20 kg to less than 25 kg	6 sachets (240 mg/60 mg) twice daily
25 kg to less than 30 kg	7 sachets (280 mg/70 mg) twice daily
30 kg to less than 35 kg	8 sachets (320 mg/80 mg) twice daily
Greater than 35 kg[1]	10 sachets (400 mg/100 mg) twice daily
[1] Dosing for children greater than 35 kg may follow adult recommendations using lopinavir/ritonavir 200 mg/50 mg tablets.	

2.4 Dosage Recommendations in Pregnancy

Administer 400/100 mg of Lopinavir and Ritonavir Oral Granules twice daily in pregnant patients with no documented lopinavir-associated resistance substitutions.

- There are insufficient data to recommend dosing in pregnant women with any documented lopinavir-associated resistance substitutions.
- No dosage adjustment of Lopinavir and Ritonavir Oral Granules is required for patients during the postpartum period.

3 DOSAGE FORMS AND STRENGTHS

Lopinavir and Ritonavir Oral Granules are available containing 40 mg of lopinavir, USP and 10 mg of ritonavir, USP.

- The 40 mg/10 mg oral granules are white to creamish granular powder packaged in a foil sachet with an approximate 1000 mg total weight of powder per sachet.

4 CONTRAINDICATIONS

- Lopinavir and Ritonavir Oral Granules is contraindicated in patients with previously demonstrated clinically significant hypersensitivity (e.g., toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, urticaria, angioedema) to any of its ingredients, including ritonavir.
- Lopinavir and Ritonavir Oral Granules is contraindicated with drugs that are highly dependent on CYP3A for clearance and for which elevated plasma concentrations are associated with serious and/or life-threatening reactions.
- Lopinavir and Ritonavir Oral Granules is contraindicated with drugs that are potent CYP3A inducers where significantly reduced lopinavir plasma concentrations may be associated with the potential for loss of virologic response and possible resistance and cross-resistance.

Table 3. Drugs That Are Contraindicated with Lopinavir and Ritonavir Oral Granules

Drug Class	Drugs Within Class That Are Contraindicated with Lopinavir and Ritonavir Oral Granules	Clinical Comments
Alpha 1-Adrenoreceptor Antagonist	Alfuzosin	Potentially increased alfuzosin concentrations can result in hypotension.
Antianginal	Ranolazine	Potential for serious and/or life-threatening reactions.
Antiarrhythmic	Dronedarone	Potential for cardiac arrhythmias.
Anti-gout	Colchicine[a]	Potential for serious and/or life-threatening reactions in patients with renal and/or hepatic impairment.
Antimycobacterial	Rifampin	May lead to loss of virologic response and possible

		resistance to Lopinavir and Ritonavir Oral Granules or to the class of protease inhibitors or other co-administered antiretroviral agents.
Antipsychotics	Lurasidone Pimozide	Potential for serious and/or life-threatening reactions. Potential for serious and/or life-threatening reactions such as cardiac arrhythmias.
Ergot Derivatives	Dihydroergotamine, ergotamine, methylergonovine	Potential for acute ergot toxicity characterized by peripheral vasospasm and ischemia of the extremities and other tissues.
GI Motility Agent	Cisapride	Potential for cardiac arrhythmias.
Hepatitis C direct acting antiviral	Elbasvir/grazoprevir	Potential for the increased risk of alanine transaminase (ALT) elevations.
Herbal Products	St. John's Wort (*Hypericum perforatum*)	May lead to loss of virologic response and possible resistance to Lopinavir and Ritonavir Oral Granules or to the class of protease inhibitors.
HMG-CoA Reductase Inhibitors	Lovastatin, simvastatin	Potential for myopathy including rhabdomyolysis.
PDE5 Inhibitor	Sildenafil[b] (Revatio®) when used for the treatment of pulmonary arterial hypertension	Potential for sildenafil-associated adverse events, including visual abnormalities, hypotension, prolonged erection, and syncope.
Sedative/Hypnotics	Triazolam; orally administered midazolam[c]	Prolonged or increased sedation or respiratory depression.

[a] see Drug Interactions (7), *Table 8* for colchicine doses in patients with normal hepatic and renal function.
[b] see Drug Interactions (7), *Table 8* for co-administration of sildenafil in patients with erectile dysfunction.
[c] see Drug Interactions (7), *Table 8* for parenterally administered midazolam.

5 WARNINGS AND PRECAUTIONS

5.1 Risk of Serious Adverse Reactions Due to Drug Interactions

Initiation of Lopinavir and Ritonavir Oral Granules, a CYP3A inhibitor, in patients receiving medications metabolized by CYP3A or initiation of medications metabolized by CYP3A in patients already receiving Lopinavir and Ritonavir Oral Granules, may increase plasma concentrations of medications metabolized by CYP3A. Initiation of medications that inhibit or induce CYP3A may increase or decrease concentrations of lopinavir and ritonavir, respectively. These interactions may lead to:

- Clinically significant adverse reactions, potentially leading to severe, life-threatening, or fatal events from greater exposures of concomitant medications.
- Clinically significant adverse reactions from greater exposures of lopinavir and ritonavir.
- Loss of therapeutic effect of lopinavir and ritonavir and possible development of resistance.

See Table 8 for steps to prevent or manage these possible and known significant drug interactions, including dosing recommendations *[see Drug Interactions (7)]*. Consider the potential for drug interactions prior to and during Lopinavir and Ritonavir Oral Granules therapy; review concomitant medications during Lopinavir and Ritonavir Oral Granules therapy, and monitor for the adverse reactions associated with the concomitant medications *[see Contraindications (4) and Drug Interactions (7)]*.

5.2 Toxicity in Preterm Neonates

Lopinavir and Ritonavir Oral Granules should not be used in preterm neonates in the immediate postnatal period because of possible toxicities. A safe and effective dose of Lopinavir and Ritonavir Oral Granules in this patient population has not been established. However, if the benefit of using Lopinavir and Ritonavir Oral Granules to treat HIV infection in infants immediately after birth outweighs the potential risks, infants should be monitored closely for increases in serum osmolality and serum creatinine, and for toxicity related to Lopinavir and Ritonavir Oral Granules including: hyperosmolality, with or without lactic acidosis, renal toxicity, CNS depression (including stupor, coma, and apnea), seizures, hypotonia, cardiac arrhythmias and ECG changes, and hemolysis.

5.3 Pancreatitis

Pancreatitis has been observed in patients receiving Lopinavir and Ritonavir Oral Granules therapy, including those who developed marked triglyceride elevations. In some cases, fatalities have been observed. Although a causal relationship to Lopinavir and Ritonavir Oral Granules has not been established, marked triglyceride elevations are a risk factor for development of pancreatitis *[see Warnings and Precautions (5.9)]*. Patients with advanced HIV-1 disease may be at increased risk of elevated triglycerides and pancreatitis, and patients with a history of pancreatitis may be at increased risk for recurrence during Lopinavir and Ritonavir Oral Granules therapy.

Pancreatitis should be considered if clinical symptoms (nausea, vomiting, abdominal pain) or abnormalities in laboratory values (such as increased serum lipase or amylase values) suggestive of pancreatitis occur. Patients who exhibit these signs or symptoms should be evaluated and Lopinavir and Ritonavir Oral Granules and/or other antiretroviral therapy should be suspended as clinically appropriate.

5.4 Hepatotoxicity

Patients with underlying hepatitis B or C or marked elevations in transaminase prior to treatment may be at increased risk for developing or worsening of transaminase elevations or hepatic decompensation with use of Lopinavir and Ritonavir Oral Granules.

There have been postmarketing reports of hepatic dysfunction, including some fatalities. These have generally occurred in patients with advanced HIV-1 disease taking multiple concomitant medications in the setting of underlying chronic hepatitis or cirrhosis. A causal relationship with Lopinavir and Ritonavir Oral Granules therapy has not been established.

Elevated transaminases with or without elevated bilirubin levels have been reported in HIV-1 mono-infected and uninfected patients as early as 7 days after the initiation of Lopinavir and Ritonavir Oral Granules in conjunction with other antiretroviral agents. In some cases, the hepatic dysfunction was serious; however, a definitive causal relationship with Lopinavir and Ritonavir Oral Granules therapy has not been established.

Appropriate laboratory testing should be conducted prior to initiating therapy with Lopinavir and Ritonavir Oral Granules and patients should be monitored closely during treatment. Increased AST/ALT monitoring should be considered in the patients with underlying chronic hepatitis or cirrhosis, especially during the first several months of Lopinavir and Ritonavir Oral Granules treatment *[see Use in Specific Populations (8.6)]*.

5.5 QT Interval Prolongation

Postmarketing cases of QT interval prolongation and torsade de pointes have been reported although causality of lopinavir and ritonavir could not be established. Avoid use in patients with congenital long QT syndrome, those with hypokalemia, and with other drugs that prolong the QT interval *[see Clinical Pharmacology (12.3)]*.

5.6 PR Interval Prolongation

Lopinavir and Ritonavir Oral Granules prolongs the PR interval in some patients. Cases of second- or third-degree atrioventricular block have been reported. Lopinavir and Ritonavir Oral Granules should be used with caution in patients with underlying structural heart disease, pre-existing conduction system abnormalities, ischemic heart disease or cardiomyopathies, as these patients may be at increased risk for developing cardiac conduction abnormalities.

The impact on the PR interval of co-administration of Lopinavir and Ritonavir Oral Granules with other drugs that prolong the PR interval (including calcium channel blockers, beta-adrenergic blockers, digoxin and atazanavir) has not been evaluated. As a result, co-administration of Lopinavir and Ritonavir Oral Granules with these drugs should be undertaken with caution, particularly with those drugs metabolized by CYP3A. Clinical monitoring is recommended *[see Clinical Pharmacology (12.3)]*.

5.7 Diabetes Mellitus/Hyperglycemia

New onset diabetes mellitus, exacerbation of pre-existing diabetes mellitus, and hyperglycemia have been reported during post-marketing surveillance in HIV-1 infected patients receiving protease inhibitor therapy. Some patients required either initiation or dose adjustments of insulin or oral hypoglycemic agents for treatment of these events. In some cases, diabetic ketoacidosis

has occurred. In those patients who discontinued protease inhibitor therapy, hyperglycemia persisted in some cases. Because these events have been reported voluntarily during clinical practice, estimates of frequency cannot be made and a causal relationship between protease inhibitor therapy and these events has not been established. Consider monitoring for hyperglycemia, new onset diabetes mellitus or an exacerbation of diabetes mellitus in patients treated with Lopinavir and Ritonavir Oral Granules.

5.8 Immune Reconstitution Syndrome

Immune reconstitution syndrome has been reported in patients treated with combination antiretroviral therapy, including Lopinavir and Ritonavir Oral Granules. During the initial phase of combination antiretroviral treatment, patients whose immune system responds may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia [PCP], or tuberculosis) which may necessitate further evaluation and treatment.

Autoimmune disorders (such as Graves' disease, polymyositis, and Guillain-Barré syndrome) have also been reported to occur in the setting of immune reconstitution, however, the time to onset is more variable, and can occur many months after initiation of treatment.

5.9 Lipid Elevations

Treatment with Lopinavir and Ritonavir Oral Granules has resulted in large increases in the concentration of total cholesterol and triglycerides *[see Adverse Reactions (6.1)]*. Triglyceride and cholesterol testing should be performed prior to initiating Lopinavir and Ritonavir Oral Granules therapy and at periodic intervals during therapy. Lipid disorders should be managed as clinically appropriate, taking into account any potential drug-drug interactions with Lopinavir and Ritonavir Oral Granules and HMG-CoA reductase inhibitors *[see Contraindications (4) and Drug Interactions (7.3)]*.

5.10 Fat Redistribution

Redistribution/accumulation of body fat including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A causal relationship has not been established.

5.11 Patients with Hemophilia

Increased bleeding, including spontaneous skin hematomas and hemarthrosis have been reported in patients with hemophilia type A and B treated with protease inhibitors. In some patients, additional factor VIII was given. In more than half of the reported cases, treatment with protease inhibitors was continued or reintroduced. A causal relationship between protease inhibitor therapy and these events has not been established.

5.12 Resistance/Cross-resistance

Because the potential for HIV cross-resistance among protease inhibitors has not been fully explored in Lopinavir and Ritonavir Oral Granules-treated patients, it is unknown what effect

therapy with Lopinavir and Ritonavir Oral Granules will have on the activity of subsequently administered protease inhibitors *[see Microbiology (12.4)]*.

6 ADVERSE REACTIONS

The following adverse reactions are discussed in greater detail in other sections of the labeling.

- QT Interval Prolongation, PR Interval Prolongation *[see Warnings and Precautions (5.5, 5.6)]*
- Drug Interactions *[see Warnings and Precautions (5.1)]*
- Pancreatitis *[see Warnings and Precautions (5.3)]*
- Hepatotoxicity *[see Warnings and Precautions (5.4)]*

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reactions rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

Adverse Reactions in Adults

The safety of lopinavir and ritonavir has been investigated in about 2,600 patients in Phase II-IV clinical trials, of which about 700 have received a dose of 800/200 mg once daily. Along with nucleoside reverse transcriptase inhibitors (NRTIs), in some studies, lopinavir and ritonavir was used in combination with efavirenz or nevirapine.

In clinical studies, the incidence of diarrhea in patients treated with either lopinavir and ritonavir capsules or tablets was greater in those patients treated once daily than in those patients treated twice daily. Any grade of diarrhea was reported by at least half of patients taking once daily lopinavir and ritonavir capsules or tablets. At the time of treatment discontinuation, 4.2-6.3% of patients taking once daily lopinavir and ritonavir and 1.8-3.7% of those taking twice daily lopinavir and ritonavir reported ongoing diarrhea.

Commonly reported adverse reactions to lopinavir and ritonavir included diarrhea, nausea, vomiting, hypertriglyceridemia and hypercholesterolemia. Diarrhea, nausea and vomiting may occur at the beginning of the treatment while hypertriglyceridemia and hypercholesterolemia may occur later. The following have been identified as adverse reactions of moderate or severe intensity (Table 4):

Table 4. Adverse Reactions of Moderate or Severe Intensity Occurring in at Least 0.1% of Adult Patients Receiving Lopinavir and Ritonavir in Combined Phase II/IV Studies (N = 2,612)

Hemoglobin	< 80 g/L	1%	1%	1%	1%	2%

[1] ULN = upper limit of the normal range; N/A = Not Applicable.
[2] Includes clinical laboratory data from patients receiving 400/100 mg twice daily (n = 29) or 533/133 mg twice daily (n = 28) for 84 weeks. Patients received lopinavir and ritonavir in combination with NRTIs and efavirenz.
[3] Includes clinical laboratory data from patients receiving 400/100 mg twice daily (n = 36) or 400/200 mg twice daily (n = 34) for 144 weeks. Patients received lopinavir and ritonavir in combination with NRTIs and nevirapine.
[4] Criterion for Study 802 was > 5x ULN (AST/ALT).

Adverse Reactions in Pediatric Patients

Lopinavir and ritonavir oral solution dosed up to 300/75 mg/m^2 has been studied in 100 pediatric patients 6 months to 12 years of age. The adverse reaction profile seen during Study 940 was similar to that for adult patients.

Dysgeusia (22%), vomiting (21%), and diarrhea (12%) were the most common adverse reactions of any severity reported in pediatric patients treated with combination therapy for up to 48 weeks in Study 940. A total of 8 patients experienced adverse reactions of moderate to severe intensity. The adverse reactions meeting these criteria and reported for the 8 subjects include: hypersensitivity (characterized by fever, rash and jaundice), pyrexia, viral infection, constipation, hepatomegaly, pancreatitis, vomiting, alanine aminotransferase increased, dry skin, rash, and dysgeusia. Rash was the only event of those listed that occurred in 2 or more subjects (N = 3).

Lopinavir and ritonavir oral solution dosed at 300/75 mg/m^2 has been studied in 31 pediatric patients 14 days to 6 months of age. The adverse reaction profile in Study 1030 was similar to that observed in older children and adults. No adverse reaction was reported in greater than 10% of subjects. Adverse drug reactions of moderate to severe intensity occurring in 2 or more subjects included decreased neutrophil count (N = 3), anemia (N = 2), high potassium (N = 2), and low sodium (N = 2).

Lopinavir and ritonavir oral solution and soft gelatin capsules dosed at higher than recommended doses including 400/100 mg/m^2 (without concomitant NNRTI) and 480/120 mg/m^2 (with concomitant NNRTI) have been studied in 26 pediatric patients 7 to 18 years of age in Study 1038. Patients also had saquinavir mesylate added to their regimen at Week 4. Rash (12%), blood cholesterol abnormal (12%) and blood triglycerides abnormal (12%) were the only adverse reactions reported in greater than 10% of subjects. Adverse drug reactions of moderate to severe

intensity occurring in 2 or more subjects included rash (N = 3), blood triglycerides abnormal (N = 3), and electrocardiogram QT prolonged (N = 2). Both subjects with QT prolongation had additional predisposing conditions such as electrolyte abnormalities, concomitant medications, or pre-existing cardiac abnormalities.

Laboratory Abnormalities: The percentages of pediatric patients treated with combination therapy including lopinavir and ritonavir with Grade 3-4 laboratory abnormalities are presented in Table 7.

Table 7. Grade 3-4 Laboratory Abnormalities Reported in ≥ 2% Pediatric Patients in Study 940

Variable	Limit[1]	Lopinavir and Ritonavir Twice Daily + RTIs (N = 100)
Chemistry	**High**	
Sodium	> 149 mEq/L	3%
Total Bilirubin	≥ 3.0 x ULN	3%
SGOT/AST	> 180 U/L	8%
SGPT/ALT	> 215 U/L	7%
Total Cholesterol	> 300 mg/dL	3%
Amylase	> 2.5 x ULN	7%[2]
Chemistry	**Low**	
Sodium	< 130 mEq/L	3%
Hematology	**Low**	
Platelet Count	$< 50 \times 10^9$/L	4%
Neutrophils	$< 0.40 \times 10^9$/L	2%

[1] ULN = upper limit of the normal range.
[2] Subjects with Grade 3-4 amylase confirmed by elevations in pancreatic amylase.

6.2 Postmarketing Experience

The following adverse reactions have been reported during postmarketing use of lopinavir and ritonavir. Because these reactions are reported voluntarily from a population of unknown size, it is not possible to reliably estimate their frequency or establish a causal relationship to lopinavir and ritonavir exposure.

Body as a Whole

Redistribution/accumulation of body fat has been *reported [see Warnings and Precautions (5.10)]*.

Cardiovascular

Bradyarrhythmias. First-degree AV block, second-degree AV block, third-degree AV block, QTc interval prolongation, torsades (torsade) de pointes *[see Warnings and Precautions (5.5, 5.6)]*.

Skin and Appendages

Toxic epidermal necrolysis (TEN), Stevens-Johnson syndrome and erythema multiforme.

7 DRUG INTERACTIONS

7.1 Potential for Lopinavir and Ritonavir Oral Granules to Affect Other Drugs

Lopinavir and Ritonavir Oral Granules is an inhibitor of CYP3A and may increase plasma concentrations of agents that are primarily metabolized by CYP3A. Agents that are extensively metabolized by CYP3A and have high first pass metabolism appear to be the most susceptible to large increases in AUC (> 3-fold) when co-administered with Lopinavir and Ritonavir Oral Granules. Thus, co-administration of Lopinavir and Ritonavir Oral Granules with drugs highly dependent on CYP3A for clearance and for which elevated plasma concentrations are associated with serious and/or life-threatening events is contraindicated. Co-administration with other CYP3A substrates may require a dose adjustment or additional monitoring as shown in Table 8.

Additionally, Lopinavir and Ritonavir Oral Granules induces glucuronidation.

Published data suggest that lopinavir is an inhibitor of OATP1B1.

7.2 Potential for Other Drugs to Affect Lopinavir

Lopinavir and Ritonavir Oral Granules is a CYP3A substrate; therefore, drugs that induce CYP3A may decrease lopinavir plasma concentrations and reduce Lopinavir and Ritonavir Oral Granules's therapeutic effect. Although not observed in the lopinavir/ritonavir/ketoconazole drug interaction study, co-administration of Lopinavir and Ritonavir Oral Granules and other drugs that inhibit CYP3A may increase lopinavir plasma concentrations.

7.3 Established and Other Potentially Significant Drug Interactions

Table 8 provides a listing of established or potentially clinically significant drug interactions. Alteration in dose or regimen may be recommended based on drug interaction studies or predicted interaction *[see Contraindications (4), Warnings and Precautions (5.1), Clinical Pharmacology (12.3)]* for magnitude of interaction.

Table 8. Established and Other Potentially Significant Drug Interactions

Concomitant Drug Class: Drug Name	**Effect on Concentration of Lopinavir or Concomitant Drug**	**Clinical Comments**
HIV-1 Antiviral Agents		
HIV-1 Protease Inhibitor: fosamprenavir/ritonavir	↓ amprenavir ↓ lopinavir	An increased rate of adverse reactions has been observed with co-administration of these medications. Appropriate doses of the combinations with respect to safety and efficacy have not been established.
HIV-1 Protease Inhibitor: indinavir*	↑ indinavir	Decrease indinavir dose to 600 mg twice daily, when co-administered with Lopinavir and Ritonavir Oral Granules 400/100 mg twice daily. Lopinavir and Ritonavir Oral Granules once daily has not been studied in combination with indinavir.
HIV-1 Protease Inhibitor:	↑ nelfinavir	Increase the dose of Lopinavir and Ritonavir

nelfinavir*	↑ M8 metabolite of nelfinavir ↓ lopinavir	Oral Granules when co-administered with nelfinavir in adults *[see Dosage and Administration (2)]*. Lopinavir and Ritonavir Oral Granules once daily in combination with nelfinavir is not recommended.
HIV-1 Protease Inhibitor: ritonavir*	↑ lopinavir	Appropriate doses of additional ritonavir in combination with Lopinavir and Ritonavir Oral Granules with respect to safety and efficacy have not been established.
HIV-1 Protease Inhibitor: saquinavir	↑ saquinavir	The saquinavir dose is 1000 mg twice daily, when co-administered with Lopinavir and Ritonavir Oral Granules 400/100 mg twice daily. Lopinavir and Ritonavir Oral Granules once daily has not been studied in combination with saquinavir.
HIV-1 Protease Inhibitor: tipranavir*	↓ lopinavir	Co-administration with tipranavir (500 mg twice daily) and ritonavir (200 mg twice daily) is not recommended.
HIV CCR5 – Antagonist: maraviroc*	↑ maraviroc	When co-administered, patients should receive 150 mg twice daily of maraviroc. For further details see complete prescribing information for maraviroc.
Non-nucleoside Reverse Transcriptase Inhibitors: efavirenz*, nevirapine*	↓ lopinavir	Increase the dose of Lopinavir and Ritonavir Oral Granules when co-administered with efavirenz or nevirapine in adults *[see Dosage and Administration (2)]*. Lopinavir and Ritonavir Oral Granules once daily in combination with efavirenz or nevirapine is not recommended.
Non-nucleoside Reverse Transcriptase Inhibitor: delavirdine	↑ lopinavir	Appropriate doses of the combination with respect to safety and efficacy have not been established.
Nucleoside Reverse Transcriptase Inhibitor: didanosine		For Lopinavir and Ritonavir Oral Granules, it is recommended that didanosine be administered on an empty stomach; therefore, didanosine should be given one hour before or two hours after Lopinavir and Ritonavir Oral Granules (given with food).
Nucleoside Reverse Transcriptase Inhibitor: tenofovir disoproxil fumarate*	↑ tenofovir	Patients receiving Lopinavir and Ritonavir Oral Granules and tenofovir should be monitored for adverse reactions associated with tenofovir.
Nucleoside Reverse Transcriptase Inhibitors: abacavir zidovudine	↓ abacavir ↓ zidovudine	The clinical significance of this potential interaction is unknown.

Other Agents		
Antiarrhythmics e.g. amiodarone, bepridil, lidocaine (systemic), quinidine	↑ antiarrhythmics	For contraindicated antiarrhythmics, *[see Contraindications (4)]*. Caution is warranted and therapeutic concentration monitoring (if available) is recommended for antiarrhythmics when co-administered with Lopinavir and Ritonavir Oral Granules.
Anticancer Agents: vincristine, vinblastine, dasatinib, nilotinib, venetoclax	↑ anticancer agents	For vincristine and vinblastine, consideration should be given to temporarily withholding the ritonavir-containing antiretroviral regimen in patients who develop significant hematologic or gastrointestinal side effects when Lopinavir and Ritonavir Oral Granules is administered concurrently with vincristine or vinblastine. If the antiretroviral regimen must be withheld for a prolonged period, consideration should be given to initiating a revised regimen that does not include a CYP3A or P-gp inhibitor. A decrease in the dosage or an adjustment of the dosing interval of nilotinib and dasatinib may be necessary for patients requiring co-administration with strong CYP3A inhibitors such as Lopinavir and Ritonavir Oral Granules. Please refer to the nilotinib and dasatinib prescribing information for dosing instructions. Co-administration of venetoclax and Lopinavir and Ritonavir Oral Granules may increase the risk of tumor lysis syndrome. Refer to the venetoclax prescribing information for dosing instructions.
Anticoagulants: warfarin, rivaroxaban	↑↓ warfarin ↑ rivaroxaban	Concentrations of warfarin may be affected. Initial frequent monitoring of the INR during Lopinavir and Ritonavir Oral Granules and warfarin co-administration is recommended. Avoid concomitant use of rivaroxaban and Lopinavir and Ritonavir Oral Granules. Co-administration of Lopinavir and Ritonavir Oral Granules and rivaroxaban may lead to increased risk of bleeding.
Anticonvulsants: carbamazepine,	↓ lopinavir ↓ phenytoin	Lopinavir and Ritonavir Oral Granules may be less effective due to decreased lopinavir

phenobarbital, phenytoin		plasma concentrations in patients taking these agents concomitantly and should be used with caution. Lopinavir and Ritonavir Oral Granules once daily in combination with carbamazepine, phenobarbital, or phenytoin is not recommended. In addition, co-administration of phenytoin and Lopinavir and Ritonavir Oral Granules may cause decreases in steady-state phenytoin concentrations. Phenytoin levels should be monitored when co-administering with Lopinavir and Ritonavir Oral Granules.
Anticonvulsants: lamotrigine, valproate	↓ lamotrigine ↓ or ↔ valproate	A dose increase of lamotrigine or valproate may be needed when co-administered with Lopinavir and Ritonavir Oral Granules and therapeutic concentration monitoring for lamotrigine may be indicated; particularly during dosage adjustments.
Antidepressant: bupropion	↓ bupropion ↓ active metabolite, hydroxybupropion	Patients receiving Lopinavir and Ritonavir Oral Granules and bupropion concurrently should be monitored for an adequate clinical response to bupropion.
Antidepressant: trazodone	↑ trazodone	Adverse reactions of nausea, dizziness, hypotension and syncope have been observed following co-administration of trazodone and ritonavir. A lower dose of trazodone should be considered.
Anti-infective: clarithromycin	↑ clarithromycin	For patients with renal impairment, adjust clarithromycin dose as follows: • For patients on Lopinavir and Ritonavir Oral Granules with CLCR 30 to 60 mL/min the dose of clarithromycin should be reduced by 50%. • For patients on Lopinavir and Ritonavir Oral Granules with CLCR < 30 mL/min the dose of clarithromycin should be decreased by 75%. No dose adjustment for patients with normal renal function is necessary.
Antifungals: ketoconazole*, itraconazole, voriconazole	↑ ketoconazole ↑ itraconazole ↓ voriconazole ↑ isavuconazonium	High doses of ketoconazole (> 200 mg/day) or itraconazole (> 200 mg/day) are not recommended.

isavuconazonium sulfate*		The co-administration of voriconazole and Lopinavir and Ritonavir Oral Granules should be avoided unless an assessment of the benefit/risk to the patient justifies the use of voriconazole. Isavuconazonium and Lopinavir and Ritonavir Oral Granules should be co-administered with caution. Alternative antifungal therapies should be considered in these patients.
Anti-gout: colchicine	↑ colchicine	Concomitant administration with colchicine is contraindicated in patients with renal and/or hepatic impairment *[see Contraindications (4)]*. <u>For patients with normal renal or hepatic function:</u> *Treatment of gout flares-co-administration of colchicine in patients on Lopinavir and Ritonavir Oral Granules:* 0.6 mg (1 tablet) x 1 dose, followed by 0.3 mg (half tablet) 1 hour later. Dose to be repeated no earlier than 3 days. *Prophylaxis of gout flares-co-administration of colchicine in patients on Lopinavir and Ritonavir Oral Granules:* If the original colchicine regimen was 0.6 mg twice a day, the regimen should be adjusted to 0.3 mg once a day. If the original colchicine regimen was 0.6 mg once a day, the regimen should be adjusted to 0.3 mg once every other day. *Treatment of familial Mediterranean fever (FMF)-co-administration of colchicine in patients on Lopinavir and Ritonavir Oral Granules:* Maximum daily dose of 0.6 mg (may be given as 0.3 mg twice a day).
Antimycobacterial: bedaquiline	↑ bedaquiline	For contraindicated antimycobacterials, *[see Contraindications (4)]*. Bedaquiline should only be used with Lopinavir and Ritonavir Oral Granules if the benefit of co-administration outweighs the risk.
Antimycobacterial:	↑ rifabutin and	Dosage reduction of rifabutin by at least 75%

rifabutin*	rifabutin metabolite	of the usual dose of 300 mg/day is recommended (i.e., a maximum dose of 150 mg every other day or three times per week). Increased monitoring for adverse reactions is warranted in patients receiving the combination. Further dosage reduction of rifabutin may be necessary.
Antiparasitic: atovaquone	↓ atovaquone	Clinical significance is unknown; however, increase in atovaquone doses may be needed.
Antipsychotics: quetiapine	↑ quetiapine	Initiation of Lopinavir and Ritonavir Oral Granules in patients taking quetiapine: Consider alternative antiretroviral therapy to avoid increases in quetiapine exposures. If co-administration is necessary, reduce the quetiapine dose to 1/6 of the current dose and monitor for quetiapine-associated adverse reactions. Refer to the quetiapine prescribing information for recommendations on adverse reaction monitoring. Initiation of quetiapine in patients taking Lopinavir and Ritonavir Oral Granules: Refer to the quetiapine prescribing information for initial dosing and titration of quetiapine.
Sedative/hypnotics: parenterally administered midazolam	↑ midazolam	For contraindicated sedative/hypnotics, *[see Contraindications (4)]*. If Lopinavir and Ritonavir Oral Granules is co-administered with parenteral midazolam, close clinical monitoring for respiratory depression and/or prolonged sedation should be exercised and dosage adjustment should be considered.
Contraceptive: ethinyl estradiol*	↓ ethinyl estradiol	Because contraceptive steroid concentrations may be altered when Lopinavir and Ritonavir Oral Granules is co-administered with oral contraceptives or with the contraceptive patch, alternative methods of nonhormonal contraception are recommended.
Systemic/Inhaled/ Nasal/Ophthalmic Corticosteroids: e.g., betamethasone budesonide ciclesonide dexamethasone fluticasone methylprednisolone	↓ lopinavir ↑ glucocorticoids	Co-administration with oral dexamethasone or other systemic corticosteroids that induce CYP3A may result in loss of therapeutic effect and development of resistance to lopinavir. Consider alternative corticosteroids. Co-administration with corticosteroids whose exposures are significantly increased by strong CYP3A inhibitors can increase the risk for

mometasone prednisone triamcinolone		Cushing's syndrome and adrenal suppression. Alternative corticosteroids including beclomethasone and prednisolone (whose PK and/or PD are less affected by strong CYP3A inhibitors relative to other studied steroids) should be considered, particularly for long-term use.
Dihydropyridine Calcium Channel Blockers: e.g. felodipine, nifedipine, nicardipine	↑ dihydropyridine calcium channel blockers	Clinical monitoring of patients is recommended and a dose reduction of the dihydropyridine calcium channel blocker may be considered.
Endothelin Receptor Antagonists: bosentan	↑ bosentan	<u>Co-administration of bosentan in patients on Lopinavir and Ritonavir Oral Granules:</u> In patients who have been receiving Lopinavir and Ritonavir Oral Granules for at least 10 days, start bosentan at 62.5 mg once daily or every other day based upon individual tolerability. <u>Co-administration of Lopinavir and Ritonavir Oral Granules in patients on bosentan:</u> Discontinue use of bosentan at least 36 hours prior to initiation of Lopinavir and Ritonavir Oral Granules. After at least 10 days following the initiation of Lopinavir and Ritonavir Oral Granules, resume bosentan at 62.5 mg once daily or every other day based upon individual tolerability.
Hepatitis C direct acting antivirals: boceprevir* simeprevir ombitasvir/paritaprevir/ ritonavir and dasabuvir*	↓ lopinavir ↓ boceprevir ↓ ritonavir ↑ simeprevir ↑ ombitasvir ↑ paritaprevir ↑ ritonavir ↔ dasabuvir	For contraindicated hepatitis C direct acting antivirals, *[see Contraindications (4)]*. It is not recommended to co-administer Lopinavir and Ritonavir Oral Granules and boceprevir, simeprevir, or ombitasvir/paritaprevir/ritonavir and dasabuvir.
HMG-CoA Reductase Inhibitors: atorvastatin rosuvastatin	↑ atorvastatin ↑ rosuvastatin	For contraindicated HMG-CoA reductase inhibitors, *[see Contraindications (4)]*. Use atorvastatin with caution and at the lowest necessary dose. Titrate rosuvastatin dose carefully and use the lowest necessary dose; do not exceed rosuvastatin 10 mg/day.

Immunosuppressants: e.g. cyclosporine, tacrolimus, sirolimus	↑ immunosuppressants	Therapeutic concentration monitoring is recommended for immunosuppressant agents when co-administered with Lopinavir and Ritonavir Oral Granules.
Long-acting beta-adrenoceptor Agonist: salmeterol	↑ salmeterol	Concurrent administration of salmeterol and Lopinavir and Ritonavir Oral Granules is not recommended. The combination may result in increased risk of cardiovascular adverse events associated with salmeterol, including QT prolongation, palpitations and sinus tachycardia.
Narcotic Analgesics: methadone*, fentanyl	↓ methadone ↑ fentanyl	Dosage of methadone may need to be increased when co-administered with Lopinavir and Ritonavir Oral Granules. Careful monitoring of therapeutic and adverse effects (including potentially fatal respiratory depression) is recommended when fentanyl is concomitantly administered with Lopinavir and Ritonavir Oral Granules.
PDE5 inhibitors: avanafil, sildenafil, tadalafil, vardenafil	↑ avanafil ↑ sildenafil ↑ tadalafil ↑ vardenafil	For contraindicated PDE5 inhibitors, *[see Contraindications (4)]*. Do not use Lopinavir and Ritonavir Oral Granules with avanafil because a safe and effective avanafil dosage regimen has not been established. Particular caution should be used when prescribing sildenafil, tadalafil, or vardenafil in patients receiving Lopinavir and Ritonavir Oral Granules. Co-administration of Lopinavir and Ritonavir Oral Granules with these drugs may result in an increase in PDE5 inhibitor associated adverse reactions including hypotension, syncope, visual changes and prolonged erection. Use of PDE5 inhibitors for pulmonary arterial hypertension (PAH): Sildenafil (Revatio®) is contraindicated *[see Contraindications (4)]*. The following dose adjustments are recommended for use of tadalafil (Adcirca®)

		with Lopinavir and Ritonavir Oral Granules: <u>Co-administration of ADCIRCA in patients on Lopinavir and Ritonavir Oral Granules:</u> In patients receiving Lopinavir and Ritonavir Oral Granules for at least one week, start ADCIRCA at 20 mg once daily. Increase to 40 mg once daily based upon individual tolerability. <u>Co-administration of Lopinavir and Ritonavir Oral Granules in patients on ADCIRCA:</u> Avoid use of ADCIRCA during the initiation of Lopinavir and Ritonavir Oral Granules. Stop ADCIRCA at least 24 hours prior to starting Lopinavir and Ritonavir Oral Granules. After at least one week following the initiation of Lopinavir and Ritonavir Oral Granules, resume ADCIRCA at 20 mg once daily. Increase to 40 mg once daily based upon individual tolerability. Use of PDE5 inhibitors for erectile dysfunction: It is recommended not to exceed the following doses: • Sildenafil: 25 mg every 48 hours • Tadalafil: 10 mg every 72 hours • Vardenafil: 2.5 mg every 72 hours Use with increased monitoring for adverse events.
* *see Clinical Pharmacology (12.3)* for magnitude of interaction.		

7.4 Drugs with No Observed or Predicted Interactions with Lopinavir and Ritonavir Oral Granules

Drug interaction or clinical studies reveal no clinically significant interaction between Lopinavir and Ritonavir Oral Granules and desipramine (CYP2D6 probe), etravirine, pitavastatin, pravastatin, stavudine, lamivudine, omeprazole, raltegravir, ranitidine, or rilpivirine.

Based on known metabolic profiles, clinically significant drug interactions are not expected between Lopinavir and Ritonavir Oral Granules and dapsone, trimethoprim/sulfamethoxazole, azithromycin, erythromycin, or fluconazole.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

Available data from the Antiretroviral Pregnancy Registry show no difference in the risk of overall major birth defects compared to the background rate for major birth defects of 2.7% in the U.S. reference population of the Metropolitan Atlanta Congenital Defects Program (MACDP) *(see Data)*. The estimated background rate of miscarriage in clinically recognized pregnancies in the U.S. general population is 15-20%. The background risk for major birth defects and miscarriage for the indicated population is unknown. Methodological limitations of the APR include the use of MACDP as the external comparator group. The MACDP population is not disease-specific, evaluates women and infants from a limited geographic area, and does not include outcomes for births that occurred at < 20 weeks gestation *(see Data)*. No treatment-related malformations were observed when lopinavir in combination with ritonavir was administered to pregnant rats or rabbits; however embryonic and fetal developmental toxicities occurred in rats administered maternally toxic doses.

Clinical Considerations

Dose Adjustments During Pregnancy and the Postpartum Period

Administer 400/100 mg of Lopinavir and Ritonavir Oral Granules twice daily in pregnant patients with no documented lopinavir-associated resistance substitutions *[see Dosage and Administration (2.4) and Clinical Pharmacology (12.3)]*. There are insufficient data to recommend Lopinavir and Ritonavir Oral Granules dosing for pregnant patients with any documented lopinavir-associated resistance substitutions. No dose adjustment of Lopinavir and Ritonavir Oral Granules is required for patients during the postpartum period.

Once daily Lopinavir and Ritonavir Oral Granules dosing is not recommended in pregnancy.

Data

Human Data

Lopinavir and ritonavir was evaluated in 12 HIV-infected pregnant women in an open-label pharmacokinetic trial *[see Clinical Pharmacology (12.3)]*. No new trends in the safety profile were identified in pregnant women dosed with Lopinavir and Ritonavir Oral Granules compared to the safety described in non-pregnant adults, based on the review of these limited data.

Antiretroviral Pregnancy Registry Data: Based on prospective reports from the Antiretroviral Pregnancy Registry (APR) of over 3,000 exposures to lopinavir containing regimens (including over 1,000 exposed in the first trimester), there was no difference between lopinavir and overall birth defects compared with the background birth defect rate of 2.7% in the U.S. reference population of the Metropolitan Atlanta Congenital Defects Program. The prevalence of birth defects in live births was 2.1% (95% CI: 1.4%-3.0%) following first-trimester exposure to lopinavir-containing regimens and 3.0% (95% CI: 2.4%-3.8%) following second and third trimester exposure to lopinavir-containing regimens. Based on prospective reports from the APR of over 5,000 exposures to ritonavir containing regimens (including over 2,000 exposures in the first trimester) there was no difference between ritonavir and overall birth defects compared with the U.S. background rate (MACDP). The prevalence of birth defects in live births was 2.2% (95% CI: 1.7%-2.8%) following first-trimester exposure to ritonavir-containing regimens and 2.9% (95% CI: 2.4%-3.6%) following second and third trimester exposure to ritonavir-

containing regimens. For both lopinavir and ritonavir, sufficient numbers of first trimester exposures have been monitored to detect at least a 1.5-fold increase in risk of overall birth defects and a 2-fold increase in risk of birth defects in the cardiovascular and genitourinary systems.

Animal Data
Embryonic and fetal developmental toxicities (early resorption, decreased fetal viability, decreased fetal body weight, increased incidence of skeletal variations and skeletal ossification delays) occurred in rats administered lopinavir in combination with ritonavir (on gestation days 6-17) at a maternally toxic dosage. Based on AUC measurements, the drug exposures in rats at the toxic doses were approximately 0.7 times (for lopinavir) and 1.8 times (for ritonavir) the exposures in humans at the recommended therapeutic dose (400/100 mg twice daily). In a pre- and postnatal study in rats, a developmental toxicity (a decrease in survival in pups between birth and postnatal Day 21) occurred.

No embryonic and fetal developmental toxicities were observed in rabbits administered lopinavir in combination with ritonavir (on gestation days 6-18) at a maternally toxic dosage. Based on AUC measurements, the drug exposures in rabbits at the toxic doses were approximately 0.6 times (for lopinavir) and similar to (for ritonavir) the exposures in humans at the recommended therapeutic dose (400/100 mg twice daily).

8.2 Lactation
Risk Summary
The Centers for Disease Control and Prevention recommend that HIV-1 infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV-1. Because of the potential for: 1) HIV transmission (in HIV-negative infants), 2) developing viral resistance (in HIV-positive infants), and 3) adverse reactions in the breastfed infant, instruct mothers not to breastfeed if they are receiving Lopinavir and Ritonavir Oral Granules.

8.3 Females and Males of Reproductive Potential
Contraception
Use of Lopinavir and Ritonavir Oral Granules may reduce the efficacy of combined hormonal contraceptives. Advise patients using combined hormonal contraceptives to use an effective alternative contraceptive method or an additional barrier method of contraception *[see Drug Interactions (7.3)]*.

8.4 Pediatric Use
The safety, efficacy, and pharmacokinetic profiles of Lopinavir and Ritonavir Oral Granules in pediatric patients below the age of 14 days have not been established. Lopinavir and Ritonavir Oral Granules should not be administered once daily in pediatric patients.

An open-label, multi-center, dose-finding trial was performed to evaluate the pharmacokinetic profile, tolerability, safety and efficacy of lopinavir and ritonavir oral solution containing lopinavir 80 mg/mL and ritonavir 20 mg/mL at a dose of 300/75 mg/m^2 twice daily plus two NRTIs in HIV-infected infants ≥ 14 days and < 6 months of age. Results revealed that infants younger than 6 months of age generally had lower lopinavir AUC_{12} than older children (6

months to 12 years of age), however, despite the lower lopinavir drug exposure observed, antiviral activity was demonstrated as reflected in the proportion of subjects who achieved HIV-1 RNA < 400 copies/mL at Week 24 *[see Adverse Reactions (6.2), Clinical Pharmacology (12.3), Clinical Studies (14.4)]*.

Safety and efficacy in pediatric patients > 6 months of age was demonstrated in a clinical trial in 100 patients. The clinical trial was an open-label, multicenter trial evaluating the pharmacokinetic profile, tolerability, safety, and efficacy of lopinavir and ritonavir oral solution containing lopinavir 80 mg/mL and ritonavir 20 mg/mL in 100 antiretroviral naïve and experienced pediatric patients ages 6 months to 12 years. Dose selection for patients 6 months to 12 years of age was based on the following results. The 230/57.5 mg/m^2 oral solution twice daily regimen without nevirapine and the 300/75 mg/m^2 oral solution twice daily regimen with nevirapine provided lopinavir plasma concentrations similar to those obtained in adult patients receiving the 400/100 mg twice daily regimen (without nevirapine) *[see Adverse Reactions (6.2), Clinical Pharmacology (12.3), Clinical Studies (14.4)]*.

A prospective multicenter, open-label trial evaluated the pharmacokinetic profile, tolerability, safety and efficacy of high-dose lopinavir and ritonavir with or without concurrent NNRTI therapy (Group 1: 400/100 mg/m^2 twice daily + ≥ 2 NRTIs; Group 2: 480/120 mg/m^2 twice daily + ≥ 1 NRTI + 1 NNRTI) in 26 children and adolescents ≥ 2 years to < 18 years of age who had failed prior therapy. Patients also had saquinavir mesylate added to their regimen. This strategy was intended to assess whether higher than approved doses of lopinavir and ritonavir could overcome protease inhibitor cross-resistance. High doses of lopinavir and ritonavir exhibited a safety profile similar to those observed in previous trials; changes in HIV-1 RNA were less than anticipated; three patients had HIV-1 RNA < 400 copies/mL at Week 48. CD4+ cell count increases were noted in the eight patients who remained on treatment for 48 weeks *[see Adverse Reactions (6.2), Clinical Pharmacology (12.3)]*.

A prospective multicenter, randomized, open-label study evaluated the efficacy and safety of twice-daily versus once-daily dosing of lopinavir and ritonavir tablets dosed by weight as part of combination antiretroviral therapy (cART) in virologically suppressed HIV-1 infected children (n = 173). Children were eligible when they were aged < 18 years, ≥ 15 kg in weight, receiving cART that included lopinavir and ritonavir, HIV-1 ribonucleic acid (RNA) < 50 copies/mL for at least 24 weeks and able to swallow tablets. At week 24, efficacy (defined as the proportion of subjects with plasma HIV-1 RNA less than 50 copies per mL) was significantly higher in subjects receiving twice daily dosing compared to subjects receiving once daily dosing. The safety profile was similar between the two treatment arms although there was a greater incidence of diarrhea in the once daily treated subjects.

8.5 Geriatric Use

Clinical studies of lopinavir and ritonavir did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. In general, appropriate caution should be exercised in the administration and monitoring of Lopinavir and Ritonavir Oral Granules in elderly patients reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

8.6 Hepatic Impairment

Lopinavir and ritonavir are principally metabolized by the liver; therefore, caution should be exercised when administering this drug to patients with hepatic impairment, because lopinavir concentrations may be increased *[see Warnings and Precautions (5.4) and Clinical Pharmacology (12.3)]*.

10 OVERDOSAGE

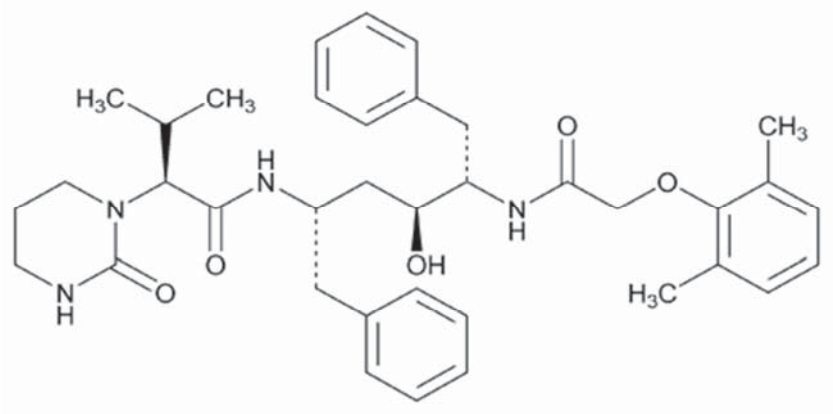
Overdoses with lopinavir and ritonavir oral solution have been reported. One of these reports described fatal cardiogenic shock in a 2.1 kg infant who received a single dose of 6.5 mL of lopinavir and ritonavir oral solution (520 mg lopinavir, approximately 10-fold above the recommended lopinavir dose) nine days prior. The following events have been reported in association with unintended overdoses in preterm neonates: complete AV block, cardiomyopathy, lactic acidosis, and acute renal failure *[see Warnings and Precautions (5.2)]*. Healthcare professionals should pay special attention to accurate calculation of the dose of Lopinavir and Ritonavir Oral Granules, transcription of the medication order, dispensing information and dosing instructions to minimize the risk for medication errors and overdose. This is especially important for infants and young children.

Human experience of acute overdosage with Lopinavir and Ritonavir Oral Granules is limited. Treatment of overdose with Lopinavir and Ritonavir Oral Granules should consist of general supportive measures including monitoring of vital signs and observation of the clinical status of the patient. There is no specific antidote for overdose with Lopinavir and Ritonavir Oral Granules. If indicated, elimination of unabsorbed drug should be achieved by gastric lavage. Administration of activated charcoal may also be used to aid in removal of unabsorbed drug. Since lopinavir is highly protein bound, dialysis is unlikely to be beneficial in significant removal of the drug.

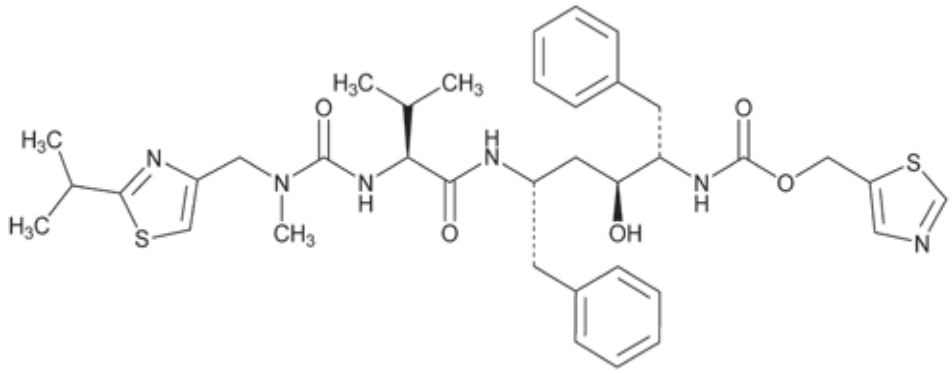
11 DESCRIPTION

Lopinavir and Ritonavir Oral Granules are a co-formulation of lopinavir and ritonavir. Lopinavir is an inhibitor of the HIV-1 protease. As co-formulated in Lopinavir and Ritonavir Oral Granules, ritonavir inhibits the CYP3A-mediated metabolism of lopinavir, thereby providing increased plasma levels of lopinavir.

Lopinavir is chemically designated as (αS)-tetrahydro-N-[(αS)-α-[(2S,3S)-2-hydroxy-4-phenyl-3-[2-(2,6-xylyloxy)acetamido]butyl]phenethyl]-α-isopropyl-2-oxo-1(2H)-pyrimidineacetamide. Its molecular formula is $C_{37}H_{48}N_4O_5$, and its molecular weight is 628.8. Lopinavir, USP is a white or almost white powder. It is freely soluble in methanol and ethanol, soluble in isopropanol and practically insoluble in water. Lopinavir has the following structural formula:



Ritonavir is chemically designated as 5-Thiazolylmethyl [(αS)-α-[(1S,3S)-1-hydroxy-3-[(2S)-2-[3-[(2-isopropyl-4-thiazolyl)methyl]-3- methylureido]-3-methylbutyramido]-4-phenylbutyl]phenethyl]carbamate. Its molecular formula is $C_{37}H_{48}N_6O_5S_2$, and its molecular weight is 720.94. Ritonavir is a white or almost white powder. It is freely soluble in methanol and ethanol, soluble in isopropanol and practically insoluble in water. Ritonavir has the following structural formula:



Lopinavir and Ritonavir Oral Granules are available for oral administration as 40 mg lopinavir and 10 mg ritonavir with the following inactive ingredients: acesulfame potassium, colloidal silicon dioxide, copovidone, ethyl cellulose, mannitol, sodium stearyl fumarate, sorbitan monolaurate and vanilla (consisting of maltodextrin, modified corn starch and natural and artificial flavors).

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Lopinavir and Ritonavir Oral Granules is a fixed-dose combination of HIV-1 antiviral drugs lopinavir *[see Microbiology (12.4)]* and ritonavir. As co-formulated in Lopinavir and Ritonavir Oral Granules, ritonavir inhibits the CYP3A-mediated metabolism of lopinavir, thereby providing increased plasma levels of lopinavir.

12.2 Pharmacodynamics

Cardiac Electrophysiology

The effect of lopinavir and ritonavir on QTcF interval was evaluated in a placebo and active (moxifloxacin 400 mg once daily) controlled crossover study in 39 healthy adults. The maximum mean time-matched (95% upper confidence bound) differences in QTcF interval from placebo after baseline-correction were 5.3 (8.1) and 15.2 (18.0) mseconds (msec) for 400/100 mg twice daily and supratherapeutic 800/200 mg twice daily lopinavir and ritonavir, respectively. Lopinavir and ritonavir 800/200 mg twice daily resulted in a Day 3 mean C_{max} approximately 2-fold higher than the mean C_{max} observed with the approved once daily and twice daily lopinavir and ritonavir doses at steady state. The maximum mean (95% upper confidence bound) difference from placebo in the PR interval after baseline-correction were 24.9 (21.5, 28.3) and 31.9 (28.5, 35.3) msec for 400/100 mg twice daily and supratherapeutic 800/200 mg twice daily lopinavir and ritonavir, respectively *[see Warnings and Precautions (5.5, 5.6)]*.

12.3 Pharmacokinetics

Lopinavir and Ritonavir Oral Granules: The pharmacokinetic properties of lopinavir and ritonavir from the Lopinavir and Ritonavir Oral Granules (2 sachets x 40 mg/10 mg) were comparable to that from KALETRA Oral Solution (80 mg/20 mg) of Abbvie Inc., USA, when single doses were administered to healthy adult subjects under fed conditions.

The pharmacokinetic properties of lopinavir are summarized in Table 9. The steady-state pharmacokinetic parameters of lopinavir are summarized in Table 10. Under fed conditions, lopinavir concentrations were similar following administration of lopinavir and ritonavir tablets to capsules with less pharmacokinetic variability. Under fed conditions (500 kcal, 25% from fat), lopinavir concentrations were similar following administration of lopinavir and ritonavir capsules and oral solution.

Table 9. Pharmacokinetic Properties of Lopinavir

Absorption

Specific Populations

Gender, Race and Age: No gender or race related pharmacokinetic differences have been observed in adult patients. Lopinavir pharmacokinetics have not been studied in elderly patients.

Pediatric Patients: The 230/57.5 mg/m^2 twice daily regimen without nevirapine and the 300/75 mg/m^2 twice daily regimen with nevirapine provided lopinavir plasma concentrations similar to those obtained in adult patients receiving the 400/100 mg twice daily regimen without nevirapine.

Table 11. Lopinavir Pharmacokinetic Data from Pediatric Clinical Trials, Mean ± SD

C_{max} (µg/mL)	C_{min} (µg/mL)	AUC_{12} (µg•hr/m)
Age ≥ 14 Days to < 6 Weeks Cohort (N = 9):		
5.17 ± 1.84[a]	1.40 ± 0.48[a]	43.39 ± 14.80[a]
Age ≥ 6 Weeks to < 6 Months Cohort (N = 18):		
9.39 ± 4.91[a]	1.95 ± 1.80[a]	74.50 ± 37.87[a]
Age ≥ 6 Months to ≤ 12 years Cohort (N = 24):		
8.2 ± 2.9[b]	3.4 ± 2.1[b]	72.6 ± 31.1[b]
10.0 ± 3.3[c]	3.6 ± 3.5[c]	85.8 ± 36.9[c]
[a] Lopinavir and ritonavir oral solution 300/75 mg/m^2 twice daily without concomitant NNRTI therapy [b] Lopinavir and ritonavir oral solution 230/57.5 mg/m^2 twice daily without nevirapine (n = 12) [c] Lopinavir and ritonavir oral solution 300/75 mg/m^2 twice daily with nevirapine (n = 12)		

Pregnancy: The C_{12h} values of lopinavir were lower during the second and third trimester by approximately 40% as compared to post-partum in 12 HIV-infected pregnant women received lopinavir and ritonavir 400 mg/100 mg twice daily. Yet this decrease is not considered clinically relevant in patients with no documented lopinavir and ritonavir-associated resistance substitutions receiving 400 mg/100 mg twice daily *[see Use in Specific Populations (8.1)]*.

Renal Impairment: Lopinavir pharmacokinetics have not been studied in patients with renal impairment; however, since the renal clearance of lopinavir is negligible, a decrease in total body clearance is not expected in patients with renal impairment.

Hepatic Impairment: Multiple dosing of lopinavir and ritonavir 400/100 mg twice daily to HIV-1 and HCV co-infected patients with mild to moderate hepatic impairment (n = 12) resulted in a 30% increase in lopinavir AUC and 20% increase in C_{max} compared to HIV-1 infected subjects with normal hepatic function (n = 12). Additionally, the plasma protein binding of lopinavir was

statistically significantly lower in both mild and moderate hepatic impairment compared to controls (99.09 vs. 99.31%, respectively). Lopinavir and ritonavir has not been studied in patients with severe hepatic impairment *[see Warnings and Precautions (5.4) and Use in Specific Populations (8.6)]*.

Drug Interactions

Lopinavir and Ritonavir Oral Granules is an inhibitor of the P450 isoform CYP3A *in vitro*. Lopinavir and Ritonavir Oral Granules does not inhibit CYP2D6, CYP2C9, CYP2C19, CYP2E1, CYP2B6 or CYP1A2 at clinically relevant concentrations.

Lopinavir and ritonavir has been shown *in vivo* to induce its own metabolism and to increase the biotransformation of some drugs metabolized by cytochrome P450 enzymes and by glucuronidation.

The effects of co-administration of lopinavir and ritonavir on the AUC, C_{max} and C_{min} are summarized in Table 12 (effect of other drugs on lopinavir) and Table 13 (effect of lopinavir and ritonavir on other drugs). For information regarding clinical recommendations, see Table 8 in *Drug Interactions (7)*.

Table 12. Drug Interactions: Pharmacokinetic Parameters for Lopinavir in the Presence of the Co-administered Drug for Recommended Alterations in Dose or Regimen

12.4 Microbiology

Mechanism of Action

Lopinavir, an inhibitor of the HIV-1 protease, prevents cleavage of the viral Gag-Pol polyprotein, resulting in the production of immature, non-infectious viral particles.

Antiviral Activity

In the absence of human serum, the mean 50% effective concentration (EC_{50}) values of lopinavir against five different HIV-1 subtype B laboratory strains in lymphoblastic cell lines ranged from 10-27 nM (0.006-0.017 μg/mL, 1 μg/mL = 1.6 μM), and ranged from 4-11 nM (0.003-0.007 μg/mL) against several HIV-1 subtype B clinical isolates in peripheral blood lymphocytes (n = 6). In the presence of 50% human serum, the mean EC_{50} values of lopinavir against these five HIV-1 laboratory strains ranged from 65-289 nM (0.04-0.18 μg/mL), representing a 7 to 11-fold attenuation. The EC_{50} values of lopinavir against three different HIV-2 strains ranged from 12180 nM (0.008-113 μg/mL).

Resistance

HIV-1 isolates with reduced susceptibility to lopinavir have been selected in cell culture. The presence of ritonavir does not appear to influence the selection of lopinavir-resistant viruses in cell culture.

In a study of 653 antiretroviral treatment-naïve patients (Study 863), plasma viral isolates from each patient on treatment with plasma HIV-1 RNA > 400 copies/mL at Week 24, 32, 40 and/or 48 were analyzed. No specific amino acid substitutions could be associated with resistance to lopinavir and ritonavir in the virus from 37 evaluable lopinavir and ritonavir-treated patients. The selection of resistance to lopinavir and ritonavir in antiretroviral treatment-naïve pediatric patients (Study 940) appears to be consistent with that seen in adult patients (Study 863).

Resistance to lopinavir and ritonavir has been noted to emerge in patients treated with other protease inhibitors prior to lopinavir and ritonavir therapy. In studies of 227 antiretroviral treatment-naïve and protease inhibitor experienced patients, isolates from 4 of 23 patients with quantifiable (> 400 copies/mL) viral RNA following treatment with lopinavir and ritonavir for 12 to 100 weeks displayed significantly reduced susceptibility to lopinavir compared to the corresponding baseline viral isolates. All four of these patients had previously received treatment with at least one protease inhibitor and had at least 4 substitutions associated with protease inhibitor resistance immediately prior to lopinavir and ritonavir therapy. Following viral rebound, isolates from these patients all contained additional substitutions, some of which are recognized to be associated with protease inhibitor resistance.

Cross-resistance - Nonclinical Studies

Varying degrees of cross-resistance have been observed among HIV-1 protease inhibitors. The antiviral activity in cell culture of lopinavir against clinical isolates from patients previously treated with a single protease inhibitor was determined (Table 14).

Table 14. Susceptibility Reduction to Lopinavir Against Isolates from Patients

Previously Treated with a Single Protease Inhibitor

Susceptibility reduced by > 4-fold	Susceptibility reduced to LPV
Indinavir (n = 16)	5.7-fold
Nelfinavir (n = 13)	< 4-fold
Ritonavir (n = 3)	8.32-fold
Saquinavir (n = 4)	< 4-fold

Isolates from patients previously treated with two or more protease inhibitors showed greater reductions in susceptibility to lopinavir, as described in the following section.

Clinical Studies -Antiviral Activity of Lopinavir and Ritonavir in Patients with Previous Protease Inhibitor Therapies

The clinical relevance of reduced susceptibility in cell culture to lopinavir has been examined by assessing the virologic response to lopinavir and ritonavir therapy in treatment-experienced patients, with respect to baseline viral genotype in three studies and baseline viral phenotype in one study.

Virologic response to lopinavir and ritonavir has been shown to be affected by the presence of three or more of the following amino acid substitutions in protease at baseline: L10F/I/R/V, K20M/N/R, L24I, L33F, M36I, I47V, G48V, I54L/T/V, V82A/C/F/S/T, and I84V. Table 15 shows the 48-week virologic response (HIV-1 RNA < 400 copies/mL) according to the number of the above protease inhibitor resistance-associated substitutions at baseline in studies 888 and 765 *[see Clinical Studies (14.2) and (14.3)]* and study 957 (see below). Once daily administration of lopinavir and ritonavir for adult patients with three or more of the above substitutions is not recommended.

Table 15. Virologic Response (HIV-1 RNA < 400 copies/mL) at Week 48 by Baseline Lopinavir and Ritonavir Susceptibility and by Number of Protease Substitutions Associated with Reduced Response to Lopinavir and Ritonavir[1]

Number of protease inhibitor substitutions at baseline[1]	Study 888 (Single protease inhibitor-experienced[2], NNRTI-naïve) n = 130	Study 765 (Single protease inhibitor-experienced[3], NNRTI-naïve) n = 56	Study 957 (Multiple protease inhibitor-experienced[4], NNRTI-naïve) n = 50
0-2	76/103 (74%)	34/45 (76%)	19/20 (95%)
3-5	13/26 (50%)	8/11 (73%)	18/26 (69%)
6 or more	0/1 (0%)	N/A	1/4 (25%)

[1] Substitutions considered in the analysis included L10F/I/R/V, K20M/N/R, L24I, L33F, M36I, I47V, G48V, I54L/T/V, V82A/C/F/S/T, and I84V.
[2] 43% indinavir, 42% nelfinavir, 10% ritonavir, 15% saquinavir.
[3] 41% indinavir, 38% nelfinavir, 4% ritonavir, 16% saquinavir.
[4] 86% indinavir, 54% nelfinavir, 80% ritonavir, 70% saquinavir.

Virologic response to lopinavir and ritonavir therapy with respect to phenotypic susceptibility to lopinavir at baseline was examined in Study 957. In this study 56 NNRTI-naïve patients with HIV-1 RNA > 1,000 copies/mL despite previous therapy with at least two protease inhibitors

selected from indinavir, nelfinavir, ritonavir, and saquinavir were randomized to receive one of two doses of lopinavir and ritonavir in combination with efavirenz and nucleoside reverse transcriptase inhibitors (NRTIs). The EC_{50} values of lopinavir against the 56 baseline viral isolates ranged from 0.5- to 96-fold the wild-type EC_{50} value. Fifty-five percent (31/56) of these baseline isolates displayed > 4-fold reduced susceptibility to lopinavir. These 31 isolates had a median reduction in lopinavir susceptibility of 18-fold. Response to therapy by baseline lopinavir susceptibility is shown in Table 16.

Table 16. HIV-1 RNA Response at Week 48 by Baseline Lopinavir Susceptibility[1]

Lopinavir susceptibility[2] at baseline	**HIV-1 RNA < 400 copies/mL (%)**	**HIV-1 RNA < 50 copies/mL (%)**
< 10-fold	25/27 (93%)	22/27 (81%)
> 10- and < 40-fold	11/15 (73%)	9/15 (60%)
≥ 40-fold	2/8 (25%)	2/8 (25%)

[1] Lopinavir susceptibility was determined by recombinant phenotypic technology performed by Virologic.
[2] Fold change in susceptibility from wild type.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Lopinavir/ritonavir combination was evaluated for carcinogenic potential by oral gavage administration to mice and rats for up to 104 weeks. Results showed an increase in the incidence of benign hepatocellular adenomas and an increase in the combined incidence of hepatocellular adenomas plus carcinoma in both males and females in mice and males in rats at doses that produced approximately 1.6-2.2 times (mice) and 0.5 times (rats) the human exposure (based on $AUC_{0\text{-}24hr}$ measurement) at the recommended dose of 400/100 mg lopinavir and ritonavir twice daily. Administration of lopinavir/ritonavir did not cause a statistically significant increase in the incidence of any other benign or malignant neoplasm in mice or rats.

Carcinogenicity studies in mice and rats have been carried out on ritonavir. In male mice, there was a dose dependent increase in the incidence of both adenomas and combined adenomas and carcinomas in the liver. Based on AUC measurements, the exposure at the high dose was approximately 4-fold for males that of the exposure in humans with the recommended therapeutic dose (400/100 mg lopinavir and ritonavir twice daily). There were no carcinogenic effects seen in females at the dosages tested. The exposure at the high dose was approximately 9-fold for the females that of the exposure in humans. There were no carcinogenic effects in rats. In this study, the exposure at the high dose was approximately 0.7-fold that of the exposure in humans with the 400/100 mg lopinavir and ritonavir twice daily regimen. Based on the exposures achieved in the animal studies, the significance of the observed effects is not known.

Mutagenesis

Neither lopinavir nor ritonavir was found to be mutagenic or clastogenic in a battery of *in vitro* and *in vivo* assays including the Ames bacterial reverse mutation assay using *S. typhimurium* and *E. coli*, the mouse lymphoma assay, the mouse micronucleus test and chromosomal aberration assays in human lymphocytes.

Impairment of Fertility
Lopinavir in combination with ritonavir at a 2:1 ratio produced no effects on fertility in male and female rats at levels of 10/5, 30/15 or 100/50 mg/kg/day. Based on AUC measurements, the exposures in rats at the high doses were approximately 0.7-fold for lopinavir and 1.8-fold for ritonavir of the exposures in humans at the recommended therapeutic dose (400/100 mg twice daily).

14 CLINICAL STUDIES

14.1 Adult Patients without Prior Antiretroviral Therapy

Study 863: Lopinavir and Ritonavir Capsules Twice Daily + Stavudine + Lamivudine Compared to Nelfinavir Three Times Daily + Stavudine + Lamivudine
Study 863 was a randomized, double-blind, multicenter trial comparing treatment with lopinavir and ritonavir capsules (400/100 mg twice daily) plus stavudine and lamivudine versus nelfinavir (750 mg three times daily) plus stavudine and lamivudine in 653 antiretroviral treatment naïve patients. Patients had a mean age of 38 years (range: 19 to 84), 57% were Caucasian, and 80% were male. Mean baseline CD4+ cell count was 259 cells/mm^3 (range: 2 to 949 cells/mm^3) and mean baseline plasma HIV-1 RNA was 4.9 $\log_{10}$ copies/mL (range: 2.6 to 6.8 $\log_{10}$ copies/mL).

Treatment response and outcomes of randomized treatment are presented in Table 17.

Table 17. Outcomes of Randomized Treatment Through Week 48 (Study 863)

Outcome	Lopinavir and Ritonavir + d4T + 3TC (N = 326)	Nelfinavir + d4T + 3TC (N = 327)
Responder[1]	75%	62%
Virologic failure[2]	9%	25%
Rebound	7%	15%
Never suppressed through Week 48	2%	9%
Death	2%	1%
Discontinued due to adverse events	4%	4%
Discontinued for other reasons[3]	10%	8%

[1] Patients achieved and maintained confirmed HIV-1 RNA < 400 copies/mL through Week 48.
[2] Includes confirmed viral rebound and failure to achieve confirmed < 400 copies/mL through Week 48.
[3] Includes lost to follow-up, patient's withdrawal, non-compliance, protocol violation and other reasons. Overall discontinuation through Week 48, including patients who discontinued subsequent to virologic failure, was 17% in the lopinavir and ritonavir arm and 24% in the nelfinavir arm.

Through 48 weeks of therapy, there was a statistically significantly higher proportion of patients in the lopinavir and ritonavir arm compared to the nelfinavir arm with HIV-1 RNA < 400 copies/mL (75% vs. 62%, respectively) and HIV-1 RNA < 50 copies/mL (67% vs. 52%, respectively). Treatment response by baseline HIV-1 RNA level subgroups is presented in Table 18.

Table 18. Proportion of Responders Through Week 48 by Baseline Viral Load (Study 863)

Baseline Viral Load (HIV-1 RNA copies/mL)	Lopinavir and Ritonavir + d4T + 3TC			Nelfinavir + d4T + 3TC		
	< 400 copies/mL[1]	< 50 copies/mL[2]	n	< 400 copies/mL[1]	< 50 copies/mL[2]	n
< 30,000	74%	71%	82	79%	72%	87
≥ 30,000 to < 100,000	81%	73%	79	67%	54%	79
≥ 100,000 to < 250,000	75%	64%	83	60%	47%	72
≥ 250,000	72%	60%	82	44%	33%	89

[1] Patients achieved and maintained confirmed HIV-1 RNA < 400 copies/mL through Week 48.
[2] Patients achieved HIV-1 RNA < 50 copies/mL at Week 48.

Through 48 weeks of therapy, the mean increase from baseline in CD4+ cell count was 207 cells/mm^3 for the lopinavir and ritonavir arm and 195 cells/mm^3 for the nelfinavir arm.

Study 730: Lopinavir and Ritonavir Tablets Once Daily + Tenofovir DF + Emtricitabine Compared to Lopinavir and Ritonavir Tablets Twice Daily + Tenofovir DF + Emtricitabine

Study 730 was a randomized, open-label, multicenter trial comparing treatment with lopinavir and ritonavir 800/200 mg once daily plus tenofovir DF and emtricitabine versus lopinavir and ritonavir 400/100 mg twice daily plus tenofovir DF and emtricitabine in 664 antiretroviral treatment-naïve patients. Patients were randomized in a 1:1 ratio to receive either lopinavir and ritonavir 800/200 mg once daily (n = 333) or lopinavir and ritonavir 400/100 mg twice daily (n = 331). Further stratification within each group was 1:1 (tablet vs. capsule). Patients administered the capsule were switched to the tablet formulation at Week 8 and maintained on their randomized dosing schedule. Patients were administered emtricitabine 200 mg once daily and tenofovir DF 300 mg once daily. Mean age of patients enrolled was 39 years (range: 19 to 71); 75% were Caucasian, and 78% were male. Mean baseline CD4+ cell count was 216 cells/mm^3 (range: 20 to 775 cells/mm^3) and mean baseline plasma HIV-1 RNA was 5.0 $\log_{10}$ copies/mL (range: 1.7 to 7.0 $\log_{10}$ copies/mL).

Treatment response and outcomes of randomized treatment through Week 48 are presented in Table 19.

Table 19. Outcomes of Randomized Treatment Through Week 48 (Study 730)

Outcome	Lopinavir and Ritonavir Once Daily + TDF + FTC (n = 333)	Lopinavir and Ritonavir Twice Daily + TDF + FTC (n = 331)
Responder[1]	78%	77%
Virologic failure[2]	10%	8%
Rebound	5%	5%
Never suppressed through Week 48	5%	3%
Death	1%	< 1%
Discontinued due to adverse events	4%	3%
Discontinued for other reasons[3]	8%	11%

[1] Patients achieved and maintained confirmed HIV-1 RNA < 50 copies/mL through Week 48.

[2] Includes confirmed viral rebound and failure to achieve confirmed < 50 copies/mL through Week 48.
[3] Includes lost to follow-up, patient's withdrawal, non-compliance, protocol violation and other reasons.

Through 48 weeks of therapy, 78% in the lopinavir and ritonavir once daily arm and 77% in the lopinavir and ritonavir twice daily arm achieved and maintained HIV-1 RNA < 50 copies/mL (95% confidence interval for the difference, -5.9% to 6.8%). Mean CD4+ cell count increases at Week 48 were 186 cells/mm^3 for the lopinavir and ritonavir once daily arm and 198 cells/mm^3 for the lopinavir and ritonavir twice daily arm.

14.2 Adult Patients with Prior Antiretroviral Therapy

Study 888: Lopinavir and Ritonavir Capsules Twice Daily + Nevirapine + NRTIs Compared to Investigator-Selected Protease Inhibitor(s) + Nevirapine + NRTIs

Study 888 was a randomized, open-label, multicenter trial comparing treatment with lopinavir and ritonavir capsules (400/100 mg twice daily) plus nevirapine and nucleoside reverse transcriptase inhibitors versus investigator-selected protease inhibitor(s) plus nevirapine and nucleoside reverse transcriptase inhibitors in 288 single protease inhibitor-experienced, non-nucleoside reverse transcriptase inhibitor (NNRTI)-naïve patients. Patients had a mean age of 40 years (range: 18 to 74), 68% were Caucasian, and 86% were male. Mean baseline CD4+ cell count was 322 cells/mm^3 (range: 10 to 1059 cells/mm^3) and mean baseline plasma HIV-1 RNA was 4.1 $\log_{10}$ copies/mL (range: 2.6 to 6.0 $\log_{10}$ copies/mL).

Treatment response and outcomes of randomized treatment through Week 48 are presented in Table 20.

Table 20. Outcomes of Randomized Treatment Through Week 48 (Study 888)

Outcome	Lopinavir and Ritonavir + nevirapine + NRTIs (n = 148)	Investigator-Selected Protease Inhibitor(s) + nevirapine + NRTIs (n = 140)
Responder[1]	57%	33%
Virologic failure[2]	24%	41%
Rebound	11%	19%
Never suppressed through Week 48	13%	23%
Death	1%	2%
Discontinued due to adverse events	5%	11%
Discontinued for other reasons[3]	14%	13%

[1] Patients achieved and maintained confirmed HIV-1 RNA < 400 copies/mL through Week 48.
[2] Includes confirmed viral rebound and failure to achieve confirmed < 400 copies/mL through Week 48.
[3] Includes lost to follow-up, patient's withdrawal, non-compliance, protocol violation and other reasons.

Through 48 weeks of therapy, there was a statistically significantly higher proportion of patients in the lopinavir and ritonavir arm compared to the investigator-selected protease inhibitor(s) arm with HIV-1 RNA < 400 copies/mL (57% vs. 33%, respectively).

Through 48 weeks of therapy, the mean increase from baseline in CD4+ cell count was 111 cells/mm^3 for the lopinavir and ritonavir arm and 112 cells/mm^3 for the investigator-selected protease inhibitor(s) arm.

Study 802: Lopinavir and Ritonavir Tablets 800/200 mg Once Daily Versus 400/100 mg Twice Daily when Co-administered with Nucleoside/Nucleotide Reverse Transcriptase Inhibitors in Antiretroviral-Experienced, HIV-1 Infected Subjects

M06-802 was a randomized open-label study comparing the safety, tolerability, and antiviral activity of once daily and twice daily dosing of lopinavir and ritonavir tablets in 599 subjects with detectable viral loads while receiving their current antiviral therapy. Of the enrolled subjects, 55% on both treatment arms had not been previously treated with a protease inhibitor and 81 – 88% had received prior NNRTIs as part of their anti-HIV treatment regimen. Patients were randomized in a 1:1 ratio to receive either lopinavir and ritonavir 800/200 mg once daily (n = 300) or lopinavir and ritonavir 400/100 mg twice daily (n = 299). Patients were administered at least two nucleoside/nucleotide reverse transcriptase inhibitors selected by the investigator. Mean age of patients enrolled was 41 years (range: 21 to 73); 51% were Caucasian, and 66% were male. Mean baseline CD4+ cell count was 254 cells/mm^3 (range: 4 to 952 cells/mm^3) and mean baseline plasma HIV-1 RNA was 4.3 $\log_{10}$ copies/mL (range: 1.7 to 6.6 $\log_{10}$ copies/mL).

Treatment response and outcomes of randomized treatment through Week 48 are presented in Table 21.

Table 21. Outcomes of Randomized Treatment Through Week 48 (Study 802)

Outcome	Lopinavir and Ritonavir Once Daily + NRTIs (n = 300)	Lopinavir and Ritonavir Twice Daily + NRTIs (n = 299)
Virologic Success (HIV-1 RNA < 50 copies/mL)	57%	54%
Virologic failure[1]	22%	24%
No virologic data in Week 48 window		
Discontinued study due to adverse event or death[2]	5%	7%
Discontinued study for other reasons[3]	13%	12%
Missing data during window but on study	3%	3%

[1] Includes patients who discontinued prior to Week 48 for lack or loss of efficacy and patients with HIV-1 RNA ≥ 50 copies/mL at Week 48.

[2] Includes patients who discontinued due to adverse events or death at any time from Day 1 through Week 48 if this resulted in no virologic data on treatment at Week 48.

[3] Includes withdrawal of consent, loss to follow-up, non-compliance, protocol violation and other reasons.

Through 48 weeks of treatment, the mean change from baseline for CD4 + cell count was 135 cells/mm^3 for the once daily group and 122 cells/mm^3 for the twice daily group.

14.3 Other Studies Supporting Approval in Adult Patients

Study 720: Lopinavir and Ritonavir Twice Daily + Stavudine + Lamivudine and
Study 765: Lopinavir and Ritonavir Twice Daily + Nevirapine + NRTIs

Study 720 (patients without prior antiretroviral therapy) and study 765 (patients with prior protease inhibitor therapy) were randomized, blinded, multi-center trials evaluating treatment with lopinavir and ritonavir at up to three dose levels (200/100 mg twice daily [720 only], 400/100 mg twice daily, and 400/200 mg twice daily). In Study 720, all patients switched to 400/100 mg twice daily between Weeks 48-72. Patients in study 720 had a mean age of 35 years, 70% were Caucasian, and 96% were male, while patients in study 765 had a mean age of 40 years, 73% were Caucasian, and 90% were male. Mean (range) baseline CD4+ cell counts for patients in study 720 and study 765 were 338 (3-918) and 372 (72-807) cells/mm^3, respectively. Mean (range) baseline plasma HIV-1 RNA levels for patients in study 720 and study 765 were 4.9 (3.3 to 6.3) and 4.0 (2.9 to 5.8) $\log_{10}$ copies/mL, respectively.

Through 360 weeks of treatment in study 720, the proportion of patients with HIV-1 RNA < 400 (< 50) copies/mL was 61% (59%) [n = 100]. Among patients completing 360 weeks of treatment with CD4+ cell count measurements [n=60], the mean (median) increase in CD4+ cell count was 501 (457) cells/mm^3. Thirty-nine patients (39%) discontinued the study, including 13 (13%) discontinuations due to adverse reactions and 1 (1%) death.

Through 144 weeks of treatment in study 765, the proportion of patients with HIV-1 RNA < 400 (< 50) copies/mL was 54% (50%) [n = 70], and the corresponding mean increase in CD4+ cell count was 212 cells/mm^3. Twenty-seven patients (39%) discontinued the study, including 5 (7%) discontinuations secondary to adverse reactions and 2 (3%) deaths.

14.4 Pediatric Studies

Study 1030 was an open-label, multicenter, dose-finding trial evaluating the pharmacokinetic profile, tolerability, safety and efficacy of lopinavir and ritonavir oral solution containing lopinavir 80 mg/mL and ritonavir 20 mg/mL at a dose of 300/75 mg/m^2 twice daily plus 2 NRTIs in HIV-1 infected infants ≥ 14 days and < 6 months of age.

Ten infants, ≥ 14 days and < 6 wks of age, were enrolled at a median (range) age of 5.7 (3.6-6.0) weeks and all completed 24 weeks. At entry, median (range) HIV-1 RNA was 6.0 (4.7-7.2) $\log_{10}$ copies/mL. Seven of 10 infants had HIV-1 RNA < 400 copies/mL at Week 24. At entry, median (range) CD4+ percentage was 41 (16-59) with a median decrease of 1% (95% CI: -10, 18) from baseline to week 24 in 6 infants with available data.

Twenty-one infants, between 6 weeks and 6 months of age, were enrolled at a median (range) age of 14.7 (6.9-25.7) weeks and 19 of 21 infants completed 24 weeks. At entry, median (range) HIV RNA level was 5.8 (3.7-6.9) $\log_{10}$ copies/mL. Ten of 21 infants had HIV RNA < 400 copies/mL at Week 24. At entry, the median (range) CD4+ percentage was 32 (11-54) with a median increase of 4% (95% CI: -1, 9) from baseline to week 24 in 19 infants with available data *[see Clinical Pharmacology (12.3) for pharmacokinetic results]*.

Study 940 was an open-label, multicenter trial evaluating the pharmacokinetic profile, tolerability, safety and efficacy of lopinavir and ritonavir oral solution containing lopinavir 80 mg/mL and ritonavir 20 mg/mL in 100 antiretroviral naïve (44%) and experienced (56%) pediatric patients. All patients were non-nucleoside reverse transcriptase inhibitor naïve. Patients were randomized to either 230 mg lopinavir/57.5 mg ritonavir per m^2 or 300 mg lopinavir/75 mg ritonavir per m^2. Naïve patients also received lamivudine and stavudine. Experienced patients received nevirapine plus up to two nucleoside reverse transcriptase inhibitors.

Safety, efficacy and pharmacokinetic profiles of the two dose regimens were assessed after three weeks of therapy in each patient. After analysis of these data, all patients were continued on the 300 mg lopinavir/75 mg ritonavir per m^2 dose. Patients had a mean age of 5 years (range 6 months to 12 years) with 14% less than 2 years. Mean baseline CD4+ cell count was 838 cells/mm^3 and mean baseline plasma HIV-1 RNA was 4.7 $\log_{10}$ copies/mL.

Through 48 weeks of therapy, the proportion of patients who achieved and sustained an HIV-1 RNA < 400 copies/mL was 80% for antiretroviral naïve patients and 71% for antiretroviral experienced patients. The mean increase from baseline in CD4+ cell count was 404 cells/mm^3 for antiretroviral naïve and 284 cells/mm^3 for antiretroviral experienced patients treated through 48 weeks. At 48 weeks, two patients (2%) had prematurely discontinued the study. One antiretroviral naïve patient prematurely discontinued secondary to an adverse reaction, while one antiretroviral experienced patient prematurely discontinued secondary to an HIV-1 related event.

Dose selection in pediatric patients was based on the following:

- Among patients 14 days to 6 months of age receiving 300/75 mg/m^2 twice daily without nevirapine, plasma concentrations were lower than those observed in adults or in older children. This dose resulted in HIV-1 RNA < 400 copies/mL in 55% of patients (70% in those initiating treatment at < 6 weeks of age).
- Among patients 6 months to 12 years of age, the 230/57.5 mg/m^2 oral solution twice daily regimen without nevirapine and the 300/75 mg/m^2 oral solution twice daily regimen with nevirapine provided lopinavir plasma concentrations similar to those obtained in adult patients receiving the 400/100 mg twice daily regimen (without nevirapine). These doses resulted in treatment benefit (proportion of patients with HIV-1 RNA < 400 copies/mL) similar to that seen in the adult clinical trials.
- Among patients 12 to 18 years of age receiving 400/100 mg/m^2 or 480/120 mg/m^2 (with efavirenz) twice daily, plasma concentrations were 60-100% higher than among 6 to 12 year old patients receiving 230/57.5 mg/m^2. Mean apparent clearance was similar to that observed in adult patients receiving standard dose and in patients 6 to 12 years of age. Although changes in HIV-1 RNA in patients with prior treatment failure were less than anticipated, the pharmacokinetic data supports use of similar dosing as in patients 6 to 12 years of age, not to exceed the recommended adult dose.
- For all age groups, the body surface area dosing was converted to body weight dosing using the patient's prescribed lopinavir dose.

16 HOW SUPPLIED/STORAGE AND HANDLING

Lopinavir and Ritonavir Oral Granules are available containing 40 mg of lopinavir, USP and 10 mg of ritonavir, USP.

The 40 mg/10 mg oral granules are white to creamish granular powder packaged in an aluminum foil sachet with an approximate 1000 mg total weight of powder per sachet.

Each carton contains 120 foil sachets that can be either cut or torn to dispense the oral granules. See sachet and carton for product and dispensing information. They are available as follows:

NDC 65015-299-50
1 carton (120 sachets per carton)

Store below 30°C (86°F).

This sachet is not child-resistant.

Dispense in original container.

PHARMACIST: Dispense a Medication Guide with each prescription.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Medication Guide and Instructions for Use)

General Administration Information *[see Dosage and Administration (2)]*

- Advise patients to pay special attention to accurate administration of their dose to minimize the risk of accidental overdose or underdose of Lopinavir and Ritonavir Oral Granules.
- Advise caregivers to inform their healthcare provider if the child's weight changes in order to make sure that the child's Lopinavir and Ritonavir Oral Granules dose is adjusted as needed.
- Inform patients and caregivers that Lopinavir and Ritonavir Oral Granules should be taken with food to enhance absorption.
- Advise patients to remain under the care of a healthcare provider while using Lopinavir and Ritonavir Oral Granules and to take Lopinavir and Ritonavir Oral Granules in combination with other antiretroviral drugs as prescribed.
- Advise patients not to alter the dose or discontinue therapy without consulting with their healthcare provider. If a dose of Lopinavir and Ritonavir Oral Granules is missed, patients should take the dose as soon as possible and then return to their normal schedule. However, if a dose is skipped the patient should not double the next dose.
- Inform patients that it is important to take Lopinavir and Ritonavir Oral Granules on a regular dosing schedule as directed and to avoid missing doses as that can result in development of resistance.
- Inform patients that there may be a greater chance of developing diarrhea with the once daily regimen as compared with the twice daily regimen.
- Inform patients that Lopinavir and Ritonavir Oral Granules is not a cure for HIV-1 infection and that they may continue to experience illnesses associated with HIV-1 infection, including opportunistic infections.

Drug Interactions
Inform patients that Lopinavir and Ritonavir Oral Granules may interact with some drugs; therefore, patients should be advised to report to their healthcare provider the use of any prescription, non-prescription medication or herbal products such as St. John's Wort *[see Contraindications (4), Warnings and Precautions (5.1) and Drug Interactions (7)]*.

Pancreatitis
Advise patients that pancreatitis has been observed in patients receiving Lopinavir and Ritonavir Oral Granules and to alert their healthcare provider if they experience symptoms such as nausea, vomiting or abdominal pain *[see Warnings and Precautions (5.3)]*.

Skin Rash
Inform patients that skin rash ranging in severity from mild to toxic epidermal necrolysis (TEN), Stevens-Johnson syndrome, erythema multiforme, urticaria, and angioedema have been reported in patients receiving Lopinavir and Ritonavir Oral Granules or its components lopinavir and/or ritonavir. Advise patients to contact their healthcare provider if they develop a rash while taking Lopinavir and Ritonavir Oral Granules *[see Adverse Reactions (6.1)]*.

Hepatotoxicity
Pre-existing liver disease including Hepatitis B or C can worsen with use of Lopinavir and Ritonavir Oral Granules. This can be seen as worsening of transaminase elevations or hepatic decompensation. Advise patients that their liver function tests will need to be monitored closely especially during the first several months of Lopinavir and Ritonavir Oral Granules treatment and that they should notify their healthcare provider if they develop the signs and symptoms of worsening liver disease including loss of appetite, abdominal pain, jaundice, and itchy skin *[see Warnings and Precautions (5.4)]*.

QT and PR Interval Prolongation
Advise patients that Lopinavir and Ritonavir Oral Granules may produce changes in the electrocardiogram (e.g., PR and/or QT prolongation) and to consult their healthcare provider if they experience symptoms such as dizziness, lightheadedness, abnormal heart rhythm or loss of consciousness *[see Warnings and Precautions (5.5, 5.6)]*.

Diabetes Mellitus/Hyperglycemia
Advise patients that new onset of diabetes or exacerbation of pre-existing diabetes mellitus, and hyperglycemia have been reported during Lopinavir and Ritonavir Oral Granules use. Advise patients to notify their healthcare provider if they develop the signs and symptoms of diabetes mellitus including frequent urination, excessive thirst, extreme hunger or unusual weight loss and/or an increased blood sugar while on Lopinavir and Ritonavir Oral Granules as they may require a change in their diabetes treatment or new treatment *[see Warnings and Precautions (5.7)]*.

Immune Reconstitution Syndrome

Advise patients that immune reconstitution syndrome has been reported in HIV-infected patients treated with combination antiretroviral therapy, including Lopinavir and Ritonavir Oral Granules *[see Warnings and Precautions (5.8)]*.

Lipid Disorders
Advise patients that treatment with Lopinavir and Ritonavir Oral Granules therapy can result in substantial increases in the concentration of total cholesterol and triglycerides *[see Warnings and Precautions (5.9)]*.

Fat Redistribution
Advise patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy and that the cause and long-term health effects of these conditions are not known at this time *[see Warnings and Precautions (5.10)]*.

Patients with Hemophilia
Advise patients with hemophilia that they may experience increased bleeding when treated with protease inhibitors such as Lopinavir and Ritonavir Oral Granules *[see Warnings and Precautions (5.11)]*.

Lactation
Instruct women with HIV-1 infection not to breastfeed because HIV-1 can be passed to the baby in breast milk *[see Use in Specific Populations (8.2)]*.

Medication Guide

Lopinavir and Ritonavir Oral Granules, 40 mg/10 mg

(loe pin′ a vir ri toe′ na vir)

What is the most important information I should know about Lopinavir and Ritonavir Oral Granules?

Lopinavir and Ritonavir Oral Granules may cause serious side effects, including:

- **Interactions with other medicines. It is important to know the medicines that should not be taken with Lopinavir and Ritonavir Oral Granules.** For more information, see **"Who should not take Lopinavir and Ritonavir Oral Granules?"**
- **Inflammation of your pancreas (pancreatitis).** Lopinavir and Ritonavir Oral Granules can cause pancreatitis which may be serious and may lead to death. People who have high levels of a certain fat (triglycerides) have a risk for developing pancreatitis. If you have advanced HIV-1 disease, you may have an increased risk of high triglyceride levels in your blood, and pancreatitis. If you have a history of pancreatitis, you may have an increased risk of it coming back again during treatment with Lopinavir and Ritonavir Oral Granules. Tell your healthcare provider if you have any signs or symptoms of pancreatitis including:
  - nausea
  - vomiting
  - stomach-area (abdominal) pain

- **Liver problems.** Liver problems, including death, can happen in people who take Lopinavir and Ritonavir Oral Granules. Your healthcare provider should do blood tests before and during your treatment with Lopinavir and Ritonavir Oral Granules to check your liver function. If you have Hepatitis B or Hepatitis C, or other liver problems, you may have an increased risk for developing new or worsening of liver problems during treatment with Lopinavir and Ritonavir Oral Granules. Tell your healthcare provider right away if you have any signs and symptoms of liver problems including:
  - loss of appetite
  - yellow skin and whites of eyes (jaundice)
  - dark-colored urine
  - pale colored stools
  - itchy skin
  - stomach area (abdominal) pain
- **Changes in your heart rhythm and the electrical activity of your heart.** These changes may be seen on an EKG (electrocardiogram) and can lead to serious heart problems. Your risk for these problems may be higher if you:
  - have a history of abnormal heart rhythm or certain types of heart problems.
  - take other medicines that can affect your heart rhythm during treatment with Lopinavir and Ritonavir Oral Granules.

Tell your healthcare provider right away if you have any of these symptoms:
- dizziness
- lightheadedness ◦
- fainting
- sensation of abnormal heartbeats

See "What are the possible side effects of Lopinavir and Ritonavir Oral Granules?" for more information about serious side effects.

What are Lopinavir and Ritonavir Oral Granules?

Lopinavir and Ritonavir Oral Granules are a prescription medicine that is used with other antiviral medicines to treat Human Immunodeficiency Virus-1 (HIV-1) infection in adults and children 14 days of age and older.

HIV is the virus that causes AIDS (Acquired Immune Deficiency Syndrome).

It is not known if Lopinavir and Ritonavir Oral Granules are safe and effective in children under 14 days old.

Who should not take Lopinavir and Ritonavir Oral Granules?

Do not take Lopinavir and Ritonavir Oral Granules if you are allergic to lopinavir, ritonavir, or any of the ingredients in Lopinavir and Ritonavir Oral Granules. See the end of this Medication Guide for a complete list of ingredients in Lopinavir and Ritonavir Oral Granules.

Do not take Lopinavir and Ritonavir Oral Granules if you take any of the following medicines:
- alfuzosin (Uroxatral®)
- cisapride (Propulsid®, Propulsid Quicksolv®)

- colchicine (Colcrys®, Col-Probenecid®, Mitigare®), if you have kidney or liver problems.
- dronedarone (Multaq®)
- elbasvir/grazoprevir (Zepatier®)
- ergot containing medicines including:
  - ergotamine tartrate (Cafergot®, Ergomar®, Ergostat®, Ergotamine®, Medihaler®, Migergot®, Wigraine®, Wigrettes®)
  - dihydroergotamine mesylate (D.H.E. 45®, Migranal®)
  - methylergonovine (Methergine®)
- lovastatin (Altoprev®, Mevacor®)
- midazolam when taken by mouth
- lurasidone (Latuda®)
- pimozide (Orap®)
- ranolazine (Ranexa®)
- rifampin (Rifadin®, Rifamate®, Rifater®, Rimactane®)
- sildenafil (Revatio®), when used for the treatment of pulmonary arterial hypertension
- simvastatin (Zocor®, Vytorin®)
- St. John's Wort (*Hypericum perforatum*®)
- triazolam (Halcion®)

Serious problems can happen if you or your child take any of the medicines listed above with Lopinavir and Ritonavir Oral Granules.

Before taking Lopinavir and Ritonavir Oral Granules, tell your healthcare provider about all of your medical conditions, including if you:

- have any heart problems, including if you have a condition called Congenital Long QT Syndrome.
- have or had pancreas problems.
- have liver problems, including Hepatitis B or Hepatitis C.
- have diabetes.
- have hemophilia. Lopinavir and Ritonavir Oral Granules may cause increased bleeding.
- have low potassium in your blood.
- are pregnant or plan to become pregnant.
  - Tell your healthcare provider if you become pregnant during treatment with Lopinavir and Ritonavir Oral Granules.
  - Lopinavir and Ritonavir Oral Granules may reduce how well hormonal birth control works. Females who may become pregnant should use another effective form of birth control or an additional barrier method of birth control during treatment with Lopinavir and Ritonavir Oral Granules.

- are breastfeeding or plan to breastfeed. **Do not breastfeed if you take Lopinavir and Ritonavir Oral Granules.**
  - You should not breastfeed if you have HIV-1 because of the risk of passing HIV-1 to your baby.
  - Talk to your healthcare provider about the best way to feed your baby.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. **Many medicines interact with Lopinavir and Ritonavir Oral Granules.**

- **Keep a list of your medicines to show your healthcare provider and pharmacist.**
- You can ask your healthcare provider or pharmacist for a list of medicines that interact with Lopinavir and Ritonavir Oral Granules.
- **Do not start taking a new medicine without telling your healthcare provider.** Your healthcare provider can tell you if it is safe to take Lopinavir and Ritonavir Oral Granules with other medicines. Your healthcare provider may need to change the dose of other medicines during treatment with Lopinavir and Ritonavir Oral Granules.

How should I take Lopinavir and Ritonavir Oral Granules?

- Take Lopinavir and Ritonavir Oral Granules every day exactly as prescribed by your healthcare provider.
- Stay under the care of your healthcare provider during treatment with Lopinavir and Ritonavir Oral Granules.
- It is important to set up a dosing schedule and follow it every day.
- Do not change your treatment or stop treatment without first talking with your healthcare provider.
- Lopinavir and Ritonavir Oral Granules **must** be taken with a meal.
- If you are taking both didanosine (Videx®) and Lopinavir and Ritonavir Oral Granules:
  - Take didanosine either 1 hour before or 2 hours after taking Lopinavir and Ritonavir Oral Granules.
- If your child is prescribed Lopinavir and Ritonavir Oral Granules:
  - Tell your healthcare provider if your child's weight changes.
  - Lopinavir and Ritonavir Oral Granules should be given to children on a 2 times each day dose schedule. When giving Lopinavir and Ritonavir Oral Granules to your child, give Lopinavir and Ritonavir Oral Granules exactly as prescribed.
- **Do not** miss a dose of Lopinavir and Ritonavir Oral Granules. This could make the virus harder to treat. If you forget to take Lopinavir and Ritonavir Oral Granules, take the missed dose right away. If it is almost time for your next dose, do not take the missed dose. Instead, follow your regular dosing schedule by taking your next dose at its regular time. Do not take more than one dose of Lopinavir and Ritonavir Oral Granules at one time.
- **If you or your child take more than the prescribed dose of Lopinavir and Ritonavir Oral Granules, call your healthcare provider or go to the nearest emergency room right away.**

What are the possible side effects of Lopinavir and Ritonavir Oral Granules?

Lopinavir and Ritonavir Oral Granules can cause serious side effects, including:

- See **"What is the most important information I should know about Lopinavir and Ritonavir Oral Granules?"**
- **Diabetes and high blood sugar (hyperglycemia).** You may develop new or worsening diabetes or high blood sugar during treatment with Lopinavir and Ritonavir Oral Granules.

Tell your healthcare provider if you get any of the following signs or symptoms:

- urinate more often than usual
- increased hunger or thirst
- unusual weight loss
- increase in your blood sugar levels

Your healthcare provider may need to start you on medicine to treat high blood sugar, or change your diabetes medicines.

- **Changes in your immune system (Immune Reconstitution Syndrome)** can happen when you start taking HIV-1 medicines. Your immune system may get stronger and begin to fight infections that have been hidden in your body for a long time. Call your healthcare provider right away if you start having new symptoms after starting your HIV-1 medicine.
- **Increases in certain fat (triglycerides and cholesterol) levels in your blood.** Large increases of triglycerides and cholesterol can be seen in blood test results of some people who take Lopinavir and Ritonavir Oral Granules. Your healthcare provider should do blood tests to check your cholesterol and triglyceride levels before you start taking Lopinavir and Ritonavir Oral Granules and during your treatment.
- **Changes in body fat** can happen in some people who take antiretroviral therapy. These changes may include increased amount of fat in the upper back and neck ("buffalo hump"), breast, and around the middle of your body (trunk). Loss of fat from the legs, arms and face may also happen. The exact cause and long-term health effects of these conditions are not known at this time.
- **Increased bleeding in people with hemophilia.** Some people with hemophilia have increased bleeding with Lopinavir and Ritonavir Oral Granules or similar medicines.
- **Skin rash, which can be severe,** can happen in people who take Lopinavir and Ritonavir Oral Granules. Tell your healthcare provider if you have a history of skin rash with other medicine used to treat your HIV-1 infection or if you get any skin rash during treatment with Lopinavir and Ritonavir Oral Granules.

Common side effects of Lopinavir and Ritonavir Oral Granules include:

- diarrhea
- nausea
- vomiting
- increased fats in blood (triglycerides or cholesterol)

These are not all of the possible side effects of Lopinavir and Ritonavir Oral Granules. For more information, ask your healthcare provider or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store Lopinavir and Ritonavir Oral Granules?

- Store Lopinavir and Ritonavir Oral Granules below 30°C (86°F).
- Store Lopinavir and Ritonavir Oral Granules in the original sachets.
- Do not open sachet until ready to use.

The sachets are not child-resistant. Keep Lopinavir and Ritonavir Oral Granules and all medicines out of the reach of children.

General information about the safe and effective use of Lopinavir and Ritonavir Oral Granules.
Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use Lopinavir and Ritonavir Oral Granules for a condition for which it was not prescribed. Do not give Lopinavir and Ritonavir Oral Granules to other people, even if they have the same condition you have. It may harm them.

You can ask your pharmacist or healthcare provider for information about Lopinavir and Ritonavir Oral Granules that is written for health professionals.

What are the ingredients in Lopinavir and Ritonavir Oral Granules?

Active ingredients: lopinavir and ritonavir

Inactive ingredients: acesulfame potassium, colloidal silicon dioxide, copovidone, ethyl cellulose, mannitol, sodium stearyl fumarate, sorbitan monolaurate and vanilla (consisting of maltodextrin, modified corn starch and natural and artificial flavors).

For more information about Lopinavir and Ritonavir Oral Granules, call Mylan at 1-877-446-3679 (1-877-4-INFO-RX).

Instructions for Use

Lopinavir and Ritonavir Oral Granules, 40 mg/10 mg

- Lopinavir and Ritonavir Oral Granules should be sprinkled/mixed with soft food such as applesauce, or mixed with liquid such as water.

- Prepare the dose using the required number of sachets. Pour and mix the entire contents of each sachet over soft food or liquid. All of the granules mixed with soft food or liquid should be administered within 2 hours of preparation. If not administered within 2 hours of preparation, the mixture should be discarded and a new dose should be prepared.

Important Information
- Lopinavir and Ritonavir Oral Granules can be prepared with either soft food or liquid.
- The soft food (applesauce) can be replaced with liquid (water) and the same steps can be followed for preparing the dose as described below.
- **Be sure to give or take the entire dose of Lopinavir and Ritonavir Oral Granules within 2 hours of preparing the dose.**

The following items are required to prepare a dose of Lopinavir and Ritonavir Oral Granules with soft food:

- Soft food such as applesauce
- Spoon (teaspoon or larger)
- Small cup or bowl (capacity about 120 grams or 4 oz.)

Instructions for preparing and administering Lopinavir and Ritonavir Oral Granules with soft food:

- **Step 1:** Place your supplies on a clean, flat surface like a table. Check to make sure your small cup or bowl and spoon are clean and dry.
- **Step 2:** Refer to the prescription labeling for the number of sachets you need to prepare a dose. Take the prescribed number of sachets out of the carton. For example, remove 1 sachet if your dose is 40 mg lopinavir/10 mg ritonavir or 2 sachets if your dose is 80 mg lopinavir/20 mg ritonavir.
- **Step 3:** Put soft food (i.e., approximately 1 teaspoon for 1 sachet; 2 teaspoons for 2 sachets, etc.) into the small cup or bowl.
- **Step 4:** Tap the sachet(s) to move all the granules to the bottom of the sachet(s). Completely tear or cut off the top of the sachet(s) and make sure the sachet(s) are fully open.
- **Step 5:** Pour all of the granules from the sachet(s) into the cup or bowl and make sure there are no granules/powder left inside the sachet(s).
- **Step 6:** Use the spoon to mix the granules in the soft food well.
- **Step 7:** Give or take the mixture. Be sure that all of the mixture is taken. If there are any granules left in the small cup/bowl or spoon, add more soft food to the granules and mix. Then give or take the mixture along with 240 mL (8 oz.) of water.

  Note: The granules should not be chewed or crushed. The mixture must be given within 2 hours of mixing with soft food. If not given within 2 hours of mixing, discard (throw away) the mixture and prepare a new dose.

- **Step 8:** Put the empty sachet(s) in the trash. Hand wash the spoon and small cup or bowl in warm water with soap. Rinse the spoon and small cup or bowl with warm water and allow to air dry. Wash and dry the area used to prepare the Lopinavir and Ritonavir Oral Granules mixture. Wash and dry your hands.

The following items are required to prepare a dose of Lopinavir and Ritonavir Oral Granules in liquid:

- Drinking glass with 4 oz. (about 120 mL) of drinking water
- Spoon (teaspoon or larger)

Instructions for preparing and administering Lopinavir and Ritonavir Oral Granules with liquid (water):

- **Step 1:** Place your supplies on a clean, flat surface like a table. Check to make sure your drinking glass and spoon are clean and dry.
- **Step 2:** Refer to the prescription labeling for the number of sachets you need to prepare a dose. Take the prescribed number of sachets out of the carton. For example, remove 1 sachet

if your dose is 40 mg lopinavir/10 mg ritonavir or 2 sachets if your dose is 80 mg lopinavir/20 mg ritonavir.

- **Step 3:** Pour approximately 4 oz. (about 120 mL) of water into the drinking glass.
- **Step 4:** Tap the sachet(s) to move all the granules to the bottom of the sachet(s). Completely tear or cut off the top of the sachet(s) and make sure the sachet(s) are fully open.
- **Step 5:** Pour all of the granules from the sachet(s) into the drinking glass and make sure there are no granules/powder left inside the sachet(s).
- **Step 6:** Use the spoon to mix the granules in the water well.
- **Step 7:** Give or take the mixture. Be sure that all of the mixture is taken. If there are any granules left in the drinking glass, add more liquid (water) to the granules and mix. Then give or take the mixture.

  Note: The granules should not be chewed or crushed. The mixture must be given within 2 hours of mixing with liquid (water). If not given within 2 hours of mixing, discard (throw away) the mixture and prepare a new dose.

- **Step 8:** Put the empty sachet(s) in the trash. Hand wash the spoon and drinking glass in warm water with soap. Rinse the spoon and drinking glass with warm water and allow to air dry. Wash and dry the area used to prepare the Lopinavir and Ritonavir Oral Granules mixture. Wash and dry your hands.

How should I store Lopinavir and Ritonavir Oral Granules?

- Store Lopinavir and Ritonavir Oral Granules below 30°C (86°F).
- Store Lopinavir and Ritonavir Oral Granules in the original sachets.
- Do not open sachet until ready to use.

For more information about Lopinavir and Ritonavir Oral Granules, call Mylan at 1-877-446-3679 (1-877-4-INFO-RX).
