## HIGHLIGHTS OF PRESCRIBING INFORMATION POM Schedule: S2 NS2 PP These highlights do not include all the information needed to use DOLUTEGRAVIR, LAMIVUDINE and TENOFOVIR DISOPROXIL FUMARATE TABLETS safely and effectively. See full prescribing information for DOLUTEGRAVIR, LAMIVUDINE and TENOFOVIR DISOPROXIL FUMARATE TABLETS. DOLUTEGRAVIR. LAMIVUDINE and TENOFOVIR DISOPROXIL FUMARATE tablets, for oral use

WARNING: LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY WITH STEATOSIS and POST TREATMENT EXACERBATIONS OF Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucl Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with HBV and human immunodeficiency virus (HIV-1) and have discontinued anti-hepatitis B therapy, including lamivudine and tenofovir disoproxil fumarate, two components of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets. Monitor hepatic function closely in these patients and, if appropriate, initiate anti-hepatitis B treatment. (5.2)

····· INDICATIONS AND USAGE ···· Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets, a combination of dolutegravir (integrase strand transfer inhibitor [INSTI]), lamivudine, and tenofovir disoproxil fumarate (both nucleoside reverse transcriptase inhibitors), are indicated for use alone as a complete regimen for the treatment of HIV-1 infection in adults and pediatric patients weighing 40 kg or greater. (1)

integrase substitutions or clinically suspected integrase strand transfer inhibitor resistance because the dose of dolutegravir in stegravir, lamivudine and tenofovir disoproxil fumarate tablets is insufficient in these subpopulations. See the dolutegravir pres --- DOSAGE AND ADMINISTRATION -----Recommended dose in adults and pediatric patients (12 years of age and older weighing at least 40 kg): One tablet once daily taken orally without food. (2.1) If dosing with certain UGT1A or CYP3A inducers, then the recommended dolutegravir dosage regimen is 50 mg twice daily. An additional 50 nd does of dollegravir, paparated by 12 hours from dolutegravir, lamivudine and tendroburidsper equinates and many the dollegravir, paparated by 12 hours from dolutegravir, lamivudine and tendroburidspersifumarate tablets, should be taken. (2.2) Because dolutegravir, lamivudine and tendroburidspersifumarate tablets are a fixed-dose tablet and cannot be dose adjusted, with renal impairment. (2.3) .....DOSAGE FORMS AND STRENGTHS...

Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets alone are not recommended in patients with resistance-associated

Tablet: 50 mg of dolutegravir, 300 mg of lamivudine, and 300 mg of tenofovir disoproxil fumarate (3)

CONTRAINDICATIONS  $Previous\ hypersensitivity\ reaction\ to\ dolute gravir,\ lamivudine,\ or\ tenofovir\ disoproxil\ fumarate.\ (4)$ ....WARNINGS AND PRECAUTIONS.

Lactic acidosis/severe hepatomegaly with steatosis: Discontinue treatment in patients who develop symptoms or laboratory findings ed hepatotoxicity. (5.1) suggestived in active across or pronounce in legicious city. 19. Patients with underlying hepatitis B or C may be at increased risk for worsening or development of transaminase elevations with use of dolutegravir, lamivudine and tendroivir disoproxil fumarate tablets. Appropriate laboratory testing prior to initiating therapy and monitoring for hepatotoxicity during therapy with dolutegravir, lamivudine and tendroivir disoproxil fumarate tablets is recommended in patients with underlying hepatic disease such as hepatitis B or C. (5.2)

## FULL PRESCRIBING INFORMATION: CONTENTS\* WARNING: LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY WITH STEATOSIS and POST TREATMENT EXACERBATIONS OF HEPATITIS B INDICATIONS AND USAGE

DOSAGE AND ADMINISTRATION
2.1 Adults and Pediatric Patients Weighing 40 kg or Greater 2.2 Dosage Recommendation with Certain Concomitant Medications
 2.3 Not Recommended Due to Lack of Dosage Adjustment

DOSAGE FORMS AND STRENGTHS CONTRAINDICATIONS

Patients with Hepatitis B Virus Co-infection Hypersensitivity Reactions Pancreatitis 5.5 New Onset or Worsening Renal Impairmen

5.9 Fat Redistribution 5.10 Immune Reconstitution Syndrome

5.11 Risk of Adverse Reactions or Loss of Virologic Response Due to Drug Interactions Clinical Trials Experience

DRUG INTERACTIONS Effect of Dolutegravir on the Pharmacokinetics of Other Agents 7.2 Effect of Other Agents on the Pharmacokinetics of Dolute
7.3 Established and Other Potentially Significant Drug Interact
7.4 Didanosine

been reported. Discontinue dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and other suspect agents immediately if signs or symptoms of hypersensitivity reactions develop, as a delay in stopping treatment may result in a life-threatening reaction. (5.3) Pancreatitis: Use with caution in pediatric patients with a history of pancreatitis or other significant risk factors for pancreatitis. ment as clinically appropriate. (5.4) Discomme treatment as clinicary appropriate, (c.4)

New onset or worsening renal impairment: Can include acute renal failure and Fanconi syndrome. Assess estimated creatinine clearance before initiating treatment with dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets. In patients at risk for renal dysfunction, assess estimated creatinine clearance, serum phosphorus, urine glucose and urine protein before initiating treatment with dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and periodically during treatment. Avoid administering dolutegravir, lamivudine and enofovir disoproxil fumarate tablets with concurrent or recent use of nephrotoxic drugs. (5.5) Hepatic decompensation, some fatal, has occurred in HIV-1/HCV co-infected patients receiving interferon and ribavirin-based regimens. Monitor for treatment-associated troicities. Discontinue dolutegravir, lamivuline and tenoforir discoroxil furnarate tablets as medically appropriate and consider dose reduction or discontinuation of interferon affa, ribavirin, or both. (5.6)

Administration of dolutegravir, lamivudine, and tenoforir discoroxil furnarate tablets is not recommended in patients receiving other products containing lamivudine, emtricitabine, tenofovir disoproxil fumarate, or tenofovir alafenamide (5.7). Do not administer in combination with adefovir dipivoxil (HEPSERA). (5.2) Decreases in bone mineral density (BMD): Consider assessment of BMD in patients with a history of pathologic fracture or other risk Decleases in John Inflament density (John). Consider assessment of bind in patients with a instity of participage fracture of other institution factors for osteoprosis or bone loss, (5.8)

Redistribution/accumulation of body fat and immune reconstitution syndrome have been reported in patients treated with combination antirectroviral therapy, (5.9, 5.10)

.....ADVERSE REACTIONS..... In adult subjects: The most common adverse reactions (in those receiving dolutegravir, lamivudine and tenofovir disoproxil fumarate) are insomnia, fatigue, and headache, nausea, nasal signs and symptoms, diarrhea, cough, rash, pain, depression, and asthenia. (6.1) In pediatric subjects: The most common adverse reactions (in those receiving lamivudine) are fever and cough. (6.1) report SUSPECTED ADVERSE REACTIONS, contact Hetero Labs Limited at 1-866-495-1995 or FDA at 1-800-FDA-1088 or

-----DRUG INTERACTIONS-----Coadministration of dolutegravir, lamivudine, and tenofovir dissporoxil furnarate tablets with other drugs can alter the concentration of other drugs and other drugs may alter the concentrations of dolutegravir, lamivudine, and tenofovir disoproxil furnarate tablets. The potential drug-drug interactions must be considered prior to and during therapy. (4, 7, 12.3) Dolutegravir, lamivudine, and tenofovir disoproxil furnarate tablets should not be administered with other antiretroviral medications for the treatment of HIV-1 infection. .....USE IN SPECIFIC POPULATIONS..... Nursing mothers: Breastfeeding is not recommended due to the potential for HIV transmission. (8.3)

Dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets are not recommended in patients with creatinine clearance less than See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling

PATIENT COUNSELING INFORMATION

Triglycerides (mg/dL)

WARNING: LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY WITH STEATOSIS and POST TREATMENT **EXACERBATIONS OF HEPATITIS B** Lactic Acidosis and Severe Hepatomegaly with Steatosis: Lactic acidosis and severe hepatomegaly with steat including fatal cases, have been reported with the use of nucleoside analogues. Discontinue dolutegravir, lamivu and tenofovir disoproxil fumarate tablets if clinical or laboratory findings suggestive of lactic acidosis or pronou hepatotoxicity occur/see Warnings and Precautions (5.1)/. Exacerbations of Hepatitis B: Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with HBV and human immunodeficiency virus (HIV-1) and have discontinued anti-hepatitis B therapy, including lamivudine or tenofovir disoproxil fumarate. Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several months in patients who discontinue dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and are co-infected with HIV-1 and HBV. If appropriate, initiation of anti-hepatitis B therapy may be warranted/see Warnings and Precautions (5.2)].

INDICATIONS AND ISAGE INDICATIONS AND USAGE

Limitation of Use: Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets alone are not recommended in patients with resistance associated integrase substitutions or clinically suspected integrase strand transfer inhibitor resistance because the dose of dolutegravir in dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets is insufficient in these subpopulations. See

DOSAGE AND ADMINISTRATION 2.1 Adults and Pediatric Patients Weighing 40 kg (88 lbs) or Greater Dolutegravir, Iamivudine and tenofovir disoproxil fumarate tablets are a fixed-dose combination product containing to only dolutegravir, 300 mg of lamivudine, and 300 mg of tenofovir disoproxil fumarate. The recommended dosage regimen of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets in adults and pediatric patients weighing 40 kg (88 lbs) or greater is one tablet 2.2 Dosage Recommendation with Certain Concomitant Medications

The dolutegravir dose (50 mg) in dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets is insufficient when coadministered with medications listed in Table 1 that may decrease dolutegravir concentrations; the following dolutegravir dosage nendations for Dolutegravir, Lamivudine and Tenofovir Disoproxil Fumarate Tablets with Coadministered Drug Dosing Recommendation The recommended dolutegravir dosage regimen is 50 mg twice daily Efavirenz, fosamprenavir/ritonavir, tipranavir/ritonav

carbamazepine, or rifampin An additional dolutegravir 50-mg tablet, separated by 12 hours from dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets, 2.3 Not Recommended Due to Lack of Dosage Adjustment

Because dolutegravir, lamivudine and tenofovir disoproxif fumarate tablets are fixed-dose combination tablets and cannot be dose adjusted, dolutegravir, lamivudine and tenofovir disoproxif fumarate tablets are not recommended in patients requiring dosage adjustment or patients with renal impairment (estimated creatinine clearance below 50 mL/min). DOSAGE FORMS AND STRENGTHS Dolutegravir, Lamivudine and Tenofovir disoproxil fumarate tablets, 50 mg/300 mg/300 mg are orange colored, modified capsule shaped, biconvex film coated tablets debossed with "H" on one side and "D" and "17" on the other side. Each tablet contains 50 mg of Dolutegravir (equivalent to 52.5 mg of todultegravir sodium), 300 mg of Lamivudine USP, and 300 mg of Tenofovir disoproxil fumarate (equivalent to 23.5 mg of tode for side for some side. 4 CONTRAINDICATIONS Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are contraindicated in patients:

with prior hypersensitivity reaction to dolutegravir [see Warnings and Precautions (5.3)], lamivudine, or tenofovir disoproxil receiving dofetilide due to the potential for increased dofetilide plasma concentrations and the risk for serious and/or life-WARNINGS AND PRECAUTIONS 5.1 Lactic Acidosis and Severe Hepatomegaly with Steatosis

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues and other antiretrovirals. A majority of these cases have been in women. Female sex and obesity may be risk factors for the development of lactic acidosis and severe hepatomegaly with steatosis in patients treated with antiretroviral nucleoside analogues. See full prescribing information for lamivudine and tenofovir disoproxil fumarate. Treatment with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be suspended in any patient who develops clinical or laboratoringings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transmissional elevations). 5.2 Patients with Hepatitis B Virus Co-infection

It is recommended that all patients with HIV1 be tested for the presence of chronic HBV before initiating antiretroviral therapy. Dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets are not approved for the treatment of chronic HBV infection, and the safety and efficacy of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets have not been established in patients coinfected with HBV and HIV1. Dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should not be administered with HEPSERA® (adefovir dipivoxil) Issecting Interactions (7-7).

Effects on Serum Liver Biochemistries: Patients with underlying hepatitis B or C may be at increased risk for worsening or development of transaminase elevations with use of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets [see Adverse Reactions (6-11)]. See full prescribing information for dolutegravir. In some cases the elevations in transaminases were consistent with immune reconstitution syndrome or hepatitis B reactivation particularly in the setting where anti-patitis therapy was withdrawn. Cases of hepatic toxicity, including elevated serum liver biochemistries, hepatitis, and acute liver failure have been reported in patients receiving ad dolutegravir-containing regimen without pre-existing hepatic disease or other identifiable risk factors. Drug-induced liver injury leading to liver transplant has been reported with a combination product of abacavir, dolutegravir and lamivudine. Monitoring for hepatotoxicity is recommended. Posttreatment Exacerbations of Hepatitis: Clinical and laboratory evidence of exacerbations of hepatitis have occurred after discontinuation of lamivudine and tenofovir disoproxil fumerate. See full prescribing information for lamivudine and tenofovir disoproxil fumerate. Patients should be closely monitored with both clinical and laboratory follow-up for at least severial months after stopping Emergence of Lamivudine-Resistant HBV: Safety and efficacy of lamivudine have not been established for treatment of chronic hepatitis B in subjects dually infected with HIV-1 and HBV. Emergence of hepatitis B virus variants associated with resistance to lamivudine has also been reported in HIV-1 infected subjects who have received lamivudine-containing antiretroviral regimens in the presence of concurrent infection with hepatitis B virus. See full prescribing information for lamivudine.

ivity reactions have been reported and were characterized by rash, constitutional findings, and sometimes Hypersensitivity reactions have been reported and were characterized by rash, constitutional findings, and sometimes organ dysfunction, including liver injury. The events were reported in less than 1% of subjects receiving dolutegravir in Phace 3 clinical trials. Discontinue dolutegravir, lamivudine, and tenofovir disoproxil furnarate tablets and other suspect agents immediately if signs or symptoms of hypersensitivity reactions develop (including, but not limited to, severe rash or rash accompanied by fever, general malaise, fatigue, muscle or joint aches, blisters or peeling of the skin, oral blisters or lesions, conjunctivitis, facial edema, hepatitis, eosinophilia, angioedema, difficulty breathing). Clinical status, including liver aminotransferases, should be monitored and appropriate therapy initiated. Delay in stopping treatment with dolutegravir, lamivudine, and tenofovir disoproxil furnarate tablets or other suspect agents after the onset of hypersensitivity may result in a life-threatening reaction. 5.4 Pancreatitis

In pediatric patients with a history of prior antiretroviral nucleoside exposure, a history of pancreatitis, or other significant risk factors for the development of pancreatitis, dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be used with caution. Treatment with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be stopped immediately if clinical signs, symptoms, or laboratory abnormalities suggestive of pancreatitis occur (see Adverse Reactions (6.1)). 5.5 New Onset or Worsening Renal Impairment Because dose interval adjustment requirement for tenofovir disoproxil fumarate for patients with CrCL below 50 mL/min and dose adjustments of lamivudine cannot be achieved with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets, patients with estimated creatinine clearance below 50 mL/min should not receive dolutegravir, lamivudine, and tenofovir disoproxil fumarate

Renal impairment, including cases of acute renal failure and Fanconi syndrome (renal tubular injury with severe hypophosphatemia), has been reported with the use of tenofovir disoproxil fumarate [see Adverse Reactions (6.2]]. It is recommended that estimated creatinine clearance be assessed in all patients prior to initiating therapy and as clinically appropriate during therapy with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets. In patients at risk of renal dysfunction, including patients who have previously experienced renal events while receiving adefovir diproxil (HEPSERA), it is recommended that estimated creatinine clearance, serum phosphorus, urine glucose, and urine protein be assept giror to initiation of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets and periodically during dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets. usoproxi rumarate tainets therapy.

Dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be avoided with concurrent or recent use of a nephrotoxic agent (e.g., high-dose or multiple non-steroidal anti-inflammatory drugs (NSAIDs) [see Drug Interactions (7.7]). Cases of acute renal failure after initiation of high-dose or multiple NSAIDs have been reported in HIV-infected patients with risk factors for renal dysfunction who appeared stable on tenofovir DF. Some patients required hospitalization and renal replacement therapy. Alternatives to NSAIDs should be considered, if needed, in patients at risk for renal dysfunction. Persistent or worsening bone pain, pain in extremities, fractures and/or muscular pain or weakness may be manifestations of proximal renal tubulopathy and should prompt an evaluation of renal function in at-risk patients.

5.6 Use with Interferon- and Ribavirin-Based Regimens Patients receiving interferon alfa with or without ribavirin and dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be closely monitored for treatment associated toxicities, especially hepatic decompensation. See full prescribing information for lamivudine. Discontinuation of doultegravir, lamivudine, and tenofovir disoproxil fumarate tablets should be considered as medically appropriate. Dose reduction or discontinuation of interferon alfa, ribavirin, or both should also be considered if worsening clinical toxicities are observed, including hepatic decompensation (e.g., Child Pugh greater than 6) (see full prescribing information for interferometal distribution. 5.7 Related Products that are Not Recommended

Dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets contains fixed doses of an INSTI (dolutegravir) and 2 nucleoside analogue reverse transcriptase inhibitors (lamivudine and tenofovir disoproxil fumarate); concomitant administration of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets with other products containing lamivudine, emtricitabine, tenofovir disoproxil fumarate, or tenofovir alafenamide is not recommended. 5.8 Bone Effects of Tenofovir Disoproxil Fumarate

Bone Mineral Density: In clinical trials in HIV-1 infected adults, tenofovir disoproxil fumarate was associated with slightly greater decreases in bone mineral density (BMD) and increases in biochemical markers of bone metabolism, suggesting increased bone turnover relative to comparators. Serum parathyroid hormone levels and 1,25 Vitamin D levels were also higher in subjects receiving tenoforir disoproxil fumarate. tendrovir disoproxil tumarate.

Clinical trials evaluating tendrovir disoproxil fumarate in pediatric and adolescent subjects were conducted. Under normal circumstances, BMD increases rapidly in pediatric patients. In HIV-1 infected subjects aged 2 years to less than 18 years, bone effects were similar to those observed in adult subjects and suggest increased bone turnover. Total body BMD gain was less in the tendrovir disoproxil fumarate-treated HIV-1 infected pediatric subjects as compared to the control groups. Similar trends were observed in chronic hepatitis B infected adolescent subjects aged 12 years to less than 18 years. In all pediatric trials, skeletal growth (height) appeared to be unaffected. For more information, consult the tendrovir disoproxil fumarate prescribing information. The effects of tenofovir disoproxil fumarate-associated changes in BMD and biochemical markers on long-term bone health and future fracture risk are unknown. Assessment of BMD should be considered for adults and pediatric patients who have a history of pathologic bone fracture or other risk factors for osteoprosis or bone loss. Although the effect of supplementation with calcium and vitamin D was not studied, such supplementation may be beneficial for all patients. If bone abnormalities are suspected then appropriate consultation should be obtained. Ameralization Defects: Cases of osteomalacia associated with proximal renal tubulopathy, manifested as bone pain or pain in extremities and which may contribute to fractures, have been reported in association with the use of tenofovir disoproxil fumarate to See Adverse Reactions (6.2). Anthroligias and muscle pain or weakness have also been reported in cases of proximal renal tubulopathy. Hypophosphatemia and osteomalacia secondary to proximal renal tubulopathy should be considered in patients at risk of renal dysfunction who present with president or worsening bone or muscle symptoms while receiving products containing tenofovir disoproxil fumarate (see Warnings and Precautions (5.5)).

5.9 Fat Redistribution Redistribution/accumulation of body fat, including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A causal relationship has not been established. 5.10 Immune Reconstitution Syndrome Immune reconstitution syndrome has been reported in patients treated with combination antiretroviral therapy, including dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets. During the initial phase of combination antiretroviral treatment, patients whose immune systems respond may develop an inflammatory response to indolent or residual opportunistic infections (such as Mycobacterium avium infection, cytomegalovirus, Pneumocystis jirovecii pneumonia [PCP], or tuberculosis), which may

Autoimmune disorders (such as Graves' disease, polymyositis, and Guillain-Barré syndrome) have also been reported to occur in the setting of immune reconstitution; however, the time to onset is more variable and can occur many months after initiation of 5.11 Risk of Adverse Reactions or Loss of Virologic Response Due to Drug Interactions The concomitant use of dolutegravir and other drugs may result in known or potentially significant drug interactions, some of which may lead to [see Contraindications (4), Drug Interactions (7.3)]:  $Loss\ of\ the rapeut ic\ effect\ of\ dolute gravir\ and\ possible\ development\ of\ resistance.$ Possible clinically significant adverse reactions from greater exposures of concomitant drugs.

For concomitant drugs for which the interaction can be mitigated, please see Table 5 for steps to prevent or manage these possible and known significant drug interactions, including dosing recommendations. Consider the potential for drug interactions prior to and during therapy with dolutegravir; review concomitant medications during therapy with dolutegravir; and monitor for the adverse reactions associated with the concomitant drugs.

ADVERSE REACTIONS  $The following serious \ adverse \ drug \ reactions \ are \ discussed \ in \ other \ sections \ of \ the \ labeling:$ Lactic Acidosis and Severe Hepatomegaly with Steatosis (see Boxed Warning, Warnings and Precautions (5.1)).

 Effects on Serum Liver Biochemistries in Patients with Hepatitis B or C Co-infection/see Warnings and Precautions (5.2)]. Severe Acute Exacerbation of Hepatitis (see Boxed Warning, Warnings and Precautions (5.2)). Hypersensitivity Reactions (see Warnings and Precautions (5.3)).

 Pancreatitis (see Warnings and Precautions (5.4)). New Onset or Worsening Renal Impairment [see Warnings and Precautions (5.5)]. Hepatic Decompensation in Patients Co-infected with HIV-1 and Hepatitis C (see Warnings and Precautions (5.6)).

 Bone Effects of Tenofovir Disoproxil Fumarate (see Warnings and Precautions (5.8)). Fat Redistribution (see Warnings and Precautions (5.9)). Immune Reconstitution Syndrome [see Warnings and Precautions (5.10)].

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared with rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice. Dolutegravir, Lamivudine, Tenofovir Disoproxil Fumarate

Serious Dolutegravir Hypersensitivity Reactions: In clinical trials, hypersensitivity reactions have occurred with dolutegravir, a component of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets (see Warnings and Precautions (5.3)). These hypersensitivity reactions have been characterized by rash, constitutional findings, and sometimes organ duration, including liver Injury.

Treatment-Naïve Subjects: In SINGLE, 833 adult subjects were randomized and received at least one dose of either dolutegravir 50 mg with fixed-dose abacavir sulfate and lamivudine once daily (n = 414) or fixed-dose efavirenz/emtricitabine/tenofovir disoproxil fumarate once daily (n = 419) (study treatment was blinded through Week 96 and open-label from Week 96 through Week 141. Through 144 weeks, the rate of adverse events leading to discontinuation was 4% in subjects receiving letgravir + fixed-dose abacavir sulfate and lamivudine and 14% in subjects receiving fixed-dose efavirenz/emtricitabine/tenofovir disoproxil fumarate once Treatment—emergent ADRs of moderate to severe intensity observed in at least 2% of subjects in either treatment arm of SINGLE are provided in Table 2. Table 2. Treatment-Emergent Adverse Drug Reactions of at Least Moderate Intensity (Grades 2 to 4) and at Least 2%

Adverse Reaction	Dolutegravir + Abacavir Sulfate and Lamivudine Once Daily (n = 414)	Efavirenz/Emtricitabine/ Tenofovir Disoproxil Fumarato Once Daily (n = 419)
Psychiatric		
Insomnia	3%	3%
Depression	1%	2%
Abnormal dreams	< 1%	2%
Nervous System		
Dizziness	< 1%	5%
Headache	2%	2%
Gastrointestinal		
Nausea	< 1%	3%
Diarrhea	< 1%	2%
General Disorders		
Fatigue	2%	2%
Skin and Subcutaneous Tissue		
Rash <sup>a</sup>	< 1%	6%
Ear and Labyrinth		

natment-Experienced Subjects: SALUNG is an international, double-blind trial in INSTI-naïve, antiretroviral treatment-experienced adult ijects. Subjects were randomized and received either dolutegravir 50 mg once daily or altegravir 400 mg twice daily with investigator-selected keyround regimen consisting of up to 2 agents, including at least one fully active agent. At 48 weeks, the rate of adverse events leading continuation was consistent with that seen in the overall treatment-naïve patient population. See full prescribing information for dolutegravit. The ADRs observed in the subset of subjects who received dolutegravir + fixed-dose abacavir sulfate and lamivudine were generally consistent ses Common Adverse Reactions Observed in Treatment-Naïve and Treatment-Experienced Trials: The following ADRs occurred in less than 2% treatment-naïve or treatment-experienced subjects receiving dolutegravir in a combination regimen in any one trial. These events have been cluded because of their seriousness and assessment of potential causal relationship. Gastrointestinal Disorders: Abdominal pain, abdominal discomfort, flatulence, upper abdominal pain, vomiting. <u> Hepatobiliary Disorders:</u> Hepatitis Musculoskeletal Disorders: Myositis. Psychiatric Disorders: Suicidal ideation, attempt, behavior, or completion. These events were observed primarily in subjects with a pre-existing history of depression or other psychiatric illness.

\*Includes pooled terms; rash, rash generalized, rash macular, rash maculo-papular, rash pruritic, and drug eruption,

Vertigo

Skin and Subcutaneous Tissue Disorders: Pruritus atory Abnormalities: Treatment-Naïve Subjects: Selected laboratory abnormalities (Grades 2 to 4) with a worsening grade from baseline presenting the worst-grade toxicity in at least 2% of subjects in SINGLE are presented in Table 3. The mean change from baseline observed ected lipid values is presented in Table 4.

Table 3. Selected Laboratory Abnormalities (Grades 2 to 4) in Treatment-Naïve Subjects in SINGLE (Week 144 Analysis) Tenofovir Disoproxil Fumara Once Daily (n = 419) (n = 414)Grade 2 (> 2.5 to 5.0 x ULN) Grade 3 to 4 (> 5.0 x ULN) 4% Grade 2 (> 2.5 to 5.0 x ULN) Grade 2 (6.0 to 9.9 x ULN) 3% 8% Grade 3 to 4 (  $\geq$  10.0 x ULN)

13.6

Subjects on lipid-lowering agents at baseline were excluded from these analyses (dolutegravir + fixed-dose abacavir sulfate and lamivudine n = 30 and fixed-dose efavirenz/emtricitabine/tenofovir disoproxil furmarate n = 27). Seventy-two subjects initiated a lipid-lowering agent post-baseline; their last fasted on-treatment values (prior to starting the agent) were used regardless if they discontinued the agent (dolutegravir + fixed-dose abacavir sulfate and lamivudine n = 36 and fixed-dose efavirenz/emtricitabine/tenofovir disoproxil furmarate n = 36). Treatment-Experienced Subjects: Laboratory abnormalities observed in SAILING were generally similar compared with observations Hepatitis B and/or Hepatitis C Virus Co-infection: In Phase 3 trials, subjects with hepatitis B and/or C virus co-infection were permitted to erroll provided that baseline liver chemistry tests did not exceed 5 times the upper limit of normal. Overall, the safety profile in subjects with hepatitis B and/or C virus co-infection was similar to that observed in subjects without hepatitis B or C co-infection, although the rates of AST and ALT abnormalities were higher in the subgroup with hepatitis B and/or C virus co-infection for all ring dŏlutegravir were observed in 18% vs. 3% with the 50 mg once daily dose and 13% vs. 8% with the 50 mg twice daily dose Liver chemistry elevations consistent with immune reconstitution syndrome were observed in some subjects with hepatitis B and/or C at the start of therapy with dolutegravir, particularly in the setting where anti-hepatitis therapy was withdrawn /see Warnings and Changes in Serum Creatinine: Dolutegravir has been shown to increase serum creatinine due to inhibition of tubular secretion of creatinine without affecting renal glomerular function [see Clinical Pharmacology (12.2)]. Increases in serum creatinine occurred within the first 4 weeks of treatment and remained stable through 95 weeks. In treatment-naïve subjects, a mean change from baseline of 0.15 mg per dL (range: -0.32 mg per dL to 0.65 mg per dL) was observed after 96 weeks of treatment. Creatinine i Clinical Trials Experience in Pediatric Subjects: IMPAACT P1093 is an ongoing multicenter, open-label, non-comparative trial of approximately 160 HIV-1-infected pediatric subjects aged 4 weeks to less than 18 years, of which 46 treatment-experienced, INSTI-naïve subjects aged 6 to less than 18 years have been enrolled isee Use in Specific Populations (8.4), Clinical Studies (14.2). The adverse reaction profile was similar to that for adults. Grade 2 ADRs reported by more than one subject were decreased neutrophil count (n = 3) and diarrhea (n = 2). There were no Grade 3 or 4 drug-related ADRs reported. No ADRs led to discontinuation. The Grade 3 or 4 laboratory abnormalities reported in more than one subject were elevated total bilirubin (n = 3) and decreased neutrophil count (n = 2). The changes in mean serum creatinine were similar to those observed in adults.

Pancreatitis: Pancreatitis, which has been fatal in some cases, has been observed in antiretroviral nucleoside-experienced pediatric subjects receiving lamivudine alone or in combination with other antiretroviral agents. In an open-label dose-escalation trial (NUCA2002), 14 subjects 14%) developed pancreatitis with receiving monotherapy with lamivudine. Three of these subjects tide of complications of pancreatitis. In a second open-label trial (NUCA2005), 12 subjects (18%) developed pancreatitis. In Trial ACTG300, pancreatitis was not observed in 236 subjects randomized to lamivudine plus zidovudine. Pancreatitis was observed in 1 subject in this trial who received open-label lamivudine in combination with zidovudine and ritonavir following discontinuation of didanosine monotherapy (see Warnings and Precautions (5.4)). Tenofovir Disoproxil Fumarate: Clinical Trials in Adult Patients with HIV-1 Infection: More than 12,000 subjects have been treated with tenofovir disoproxil fumarate alone or in combination with other antiretroviral medicinal products for periods of 28 days to 215 weeks in clinical trials and expanded access programs. A total of 1,544 subjects have received tenofovir disoproxil fumarate 300 mg once daily in clinical trials; over 1,000 subjects have received tenofovir disoproxil fumarate in expanded access programs. once daily in clinical trials; over 11,000 subjects have received tenofovir disoproxil fumarate in expanded access programs.

The most common adverse reactions (incidence greater than or equal to 10%, Grades 2 to 4) identified from any of the 3 large controlled clinical trials inclinical trials inclinical trials inclinical trials inclinical trials inclinical trials inclinical trials. Inclinical trials inclinical trials inclinical trials inclinical trials inclinical trials inclined as a superior of the service o

6.2 Postmarketing Experience In addition to adverse reactions reported from clinical trials, the following adverse reactions have been identified during postmarketing use for each of the individual components of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets. Because these reactions are reported voluntarily from a population of unknown size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Dolutegravir

Musculoskeletal: Arthralgia, myalgia. Psychiatric: Anxiety

Body as a Whole: Redistribution/accumulation of body fat /see Warnings and Precautions (5.9)]. Endocrine and Metabolic: Hyperglycemia.

Hemic and Lymphatic: Anemia (including pure red cell aplasia and severe anemias progressing on therapy). Hepatic and Pancreatic: Lactic acidosis and hepatic steatosis [see Warnings and Precautions (5.1)], posttreatment exacerbations of hepatitis B [see Warnings and Precautions (5.2)]. Musculoskeletal: Muscle weakness, CPK elevation, rhabdomyolysis

Skin: Alopecia, pruritus. Tenofovir Disoproxil Fumarate Immune System Disorders: allergic reaction, including angioedema.

 $\textbf{\textit{Metabolism and Nutrition Disorders:}} \ lactic \ acidosis, \ hypokalemia, \ hypophosphatemia.$ Respiratory, Thoracic, and Mediastinal Disorders: dyspnea. Gastrointestinal Disorders: pancreatitis, increased amylase, abdominal pain.  $\textbf{\textit{Hepatobiliary Disorders:}} \ \text{hepatic steatosis, hepatitis, increased liver enzymes (most commonly AST, ALT gamma GT).}$ Skin and Subcutaneous Tissue Disorders: rash.

Musculoskeletal and Connective Tissue Disorders: rhabdomyolysis, osteomalacia (manifested as bone pain and which may Renal and Urinary Disorders: acute renal failure, renal failure, acute tubular necrosis, Fanconi syndrome, proximal renal General Disorders and Administration Site Conditions: asthenia. The following adverse reactions, listed under the body system headings above, may occur as a consequence of proximal renal tubulopathy: rhabdomyolysis, osteomalacia, hypokalemia, muscular weakness, myopathy, hypophosphatemia.

DRUG INTERACTIONS 7.1 Effect of Dolutegravir on the Pharmacokinetics of Other Agents In vitro, dolutegravir inhibited the renal organic cation transporters, OCT2 ( $IC_{so} = 1.93 \, \mu\text{M}$ ) and multidrug and toxin extrusion transporter (MATE) 1 ( $IC_{so} = 6.34 \, \mu\text{M}$ ). In vivo, dolutegravir inhibits tubular secretion of creatinine by inhibiting OCT2 and potentially MATE1. Dolutegravir may increase plasma concentrations of drugs eliminated via OCT2 or MATE1 (dofetilide and metformin, Table 5) (see Contraindications (4), Drug Interactions (7.3)). In vitro, dolutegravir inhibited the basolateral renal transporters, organic anion transporter (OAT) 1 (IC<sub>so</sub> = 2.12 μM) and OAT3 (IC<sub>so</sub> = 1.97 µM). However, *in vivo*, dolutegravir did not alter the plasma concentrations of tenofovir or para-amino hippurate, substrates of OAT1 and OAT3. In witro, dolutegravir did not inhibit ( $IC_{00}$  greater than 50  $\mu$ M) the following: cytochrome P450 (CYP11A2, CYP2A6, CYP2B6, CYP2C8, CYP2C9, CYP2C9, CYP2C19, CYP2D6, CYP3A, uridine diphosphate (UDP)-glucuronosyl transferase 1A1 (UGT1A1), UGT2B7, Pglycoprotein (Pgp), breast cancer resistance protein (BCRP), bile salt export pump (BSEP), organic anion transporter polypeptide (0ATP)1B1, OATP1B3, OCT1, multidrug resistance protein (MRP)2, or MRP4. In vitro, dolutegravir did not induce CYP1A2, CYP2B6, OCTP3A4. Based on these data and the results of drug interaction trials, dolutegravir is not expected to affect the pharmacokinetics of drugs that are substrates o

In drug interaction trials, dolutegravir did not have a clinically relevant effect on the pharmacokinetics of the following drugs: daclatasvir, tenofovir, methadone, midazolam, rilpivirine, and oral contraceptives containing norgestimate and ethinyl estradiol. Using cross-study comparisons to historical pharmacokinetic data for each interacting drug, dolutegravir did not appear to affect the pharmacokinetics of the following drugs: atazanavir, darunavir, etavirenz, etravirine, fosamprenavir, fopinavir, ritonavir, and boceprevir.

7.2 Effect of Other Agents on the Pharmacokinetics of Dolutegravir Dolutegravir is metabolized by UGT1A1 with some contribution from CYP3A. Dolutegravir is also a substrate of UGT1A3, UGT1A9, BCRP, and P.gp in vitro. Drugs that induce those enzymes and transporters may decrease dolutegravir plasma concentration and reduce the therapeutic effect of dolutegravir. oadministration of dolutegravir and other drugs that inhibit these enzymes may increase dolutegravir plasma concentration Etravirine significantly reduced plasma concentrations of dolutegravir, but the effect of etravirine was mitigated by coadministration of lopinavirintonavir or darunavirintonavir, and is expected to be mitigated by atazanavir/ritonavir (Table 5) [see Drug Interactions of the control of the of lopinavir/ritonavir or darunavir/rit (7.3), Clinical Pharmacology (12.3)].

In vitro, dolutegravir was not a substrate of OATP1B1, or OATP1B3. Darunavir/ritonavir, lopinavir/ritonavir, rilpivirine, tenofovir, boceprevir, daclatasvir, prednisone, rifabutin, and omeprazole had no clinically significant effect on the pharmacokinetics of dolutegravir. 7.3 Established and Other Potentially Significant Drug Interactions here were no drug-drug interaction trials conducted with the dolutegravir, lamivudine, and tenofovir disoproxil fumarate fixed-dose Table 5 provides clinical recommendations as a result of drug interactions with dolutegravir. These recommendations are based on either drug interaction trials or predicted interactions due to the expected magnitude of interaction and potential for serious adverse events or loss of efficacy. /See Clinical Pharmacology (12.3). Table 5. Established and Other Potentially Significant Drug Interactions for Dolutegravir: Alterations in Dose or Regimen May Be Recommended Based on Drug Interaction Trials or Predicted Interactions

> Effect on Concentration of Dolutegravir and/or Con

	2.49	
HIV-1 Antiviral Agents		
Non-nucleoside reverse transcriptase inhibitor: Etravirine	↓Dolutegravir	Use of dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets with etravirine without coadministration of atazanavir/ritonavir, darunavir/ritonavir, or lopinavir/ritonavir is not recommended.
Non-nucleoside reverse transcriptase inhibitor: Efavirenz <sup>a</sup>	↓Dolutegravir	Adjust dolutegravir dose to 50 mg twice daily An additional 50 mg dose of dolutegrav should be taken, separated by 12 hours froi dolutegravir, lamivudine, and tenofov disoproxil fumarate tablets.
Non-nucleoside reverse transcriptase inhibitor: Nevirapine	↓Dolutegravir	Avoid coadministration with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets because there are insufficient data to make dosing recommendations.
Protease inhibitor: Fosamprenavir/ritonavir* Tipranavir/ritonavir*	↓Dolutegravir	Adjust dolutegravir dose to 50 mg twice dail An additional 50 mg dose of dolutegrav should be taken, separated by 12 hours fro dolutegravir, lamivudine, and tenofov disoproxil fumarate tablets.
Other Agents		
Dofetilide	↑Dofetilide	Coadministration is contraindicated with dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets [see Contraindications (4]].
Carbamazepine*	↓Dolutegravir	Adjust dolutegravir dose to 50 mg twice dail An additional 50 mg dose of dolutegra should be taken, separated by 12 hours for dolutegravir, lamivudine, and tenofor disoproxil fumarate tablets.
Oxcarbazepine Phenytoin Phenobarbital St. John's wort (Hypericum perforatum)	↓Dolutegravir	Avoid coadministration with dolutegravir lamivudine, and tenofovir disoproxil fumarati tablets because there are insufficient data to make dosing recommendations.
Medications containing polyvalent cations (e.g., Mg or Al): Cation-containing antacids* or laxatives Sucralfate Buffered medications	↓Dolutegravir	Administer dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets 2 hours before or 6 hours after taking medications containing polyvalent cations.
Oral calcium or iron supplements, including multivitamins containing calcium or iron*	↓Dolutegravir	Administer dolutegravir, lamivudine, ai tenofovir disoproxil fumarate tablets 2 hou before or 6 hours after taking supplemen containing calcium or iron. Alternativel dolutegravir and supplements containi calcium or iron can be taken together with foo
Metformin	↑Metformin	With concomitant use, limit the total daily do of metformin to 1000 mg either when starti metformin or dolutegravir, lamivudine, at tenofovir disoproxil fumarate tablets. Wh stopping dolutegravir, lamivudine, at tenofovir disoproxil fumarate tablets, it metformin dose may require an adjustmet Monitoring of blood glucose when initiati concomitant use and after withdrawal dolutegravir, lamivudine, and tenofov disoproxil fumarate tablets is recommended.
		Adjust dolutegravir dose to 50 mg twice dai An additional 50 mg dose of dolutegravir shou

\*See Clinical Pharmacology (12.3) Table 8 or Table 9 for magnitude of interaction 7.4 Didanosine Coadministration of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and didanosine should be undertaken with caution and patients receiving this combination should be monitored closely for didanosine associated adverse reactions. Didanosine should be discontinued in patients who develop didanosine-associated adverse reactions. When tenofovir disoproxil furnarate was administered with didanosine, C<sub>sss</sub>, and AUC of didanosine increased significantly [see Clinical Pharmacology (12.3)]. The mechanism of this interaction is unknown. Higher didanosine concentrations could potentiate didanosine-associated adverse reactions, including panereatitis and neuropathy. Suppression of CD4 cell counts has been observed in patients receiving tenofovir disoproxil furnarate with didanosine 400 mg daily. In patients weighing greater than 60 kg, the didanosine dose should be reduced to 250 mg once daily when it is coadministered with In patients weigning greater than do sp. the unadrable uses should be reduced a 250 mg of the usary when it is clearministened with dolutegravit, lamivudine and tenofovir disproxif fumarate tablests. Data are not available to recommend a dose adjustment of didanosine for adult of pediatric patients weighing less than 60 kg. When coadministered, dolutegravit, lamivudine and tenoforiu disproxif fumarate tablets and didanosine EC may be taken under fasted conditions or with a light meal (ess than 400 kcal, 20% fat). Tenofovir disoproxil fumarate decreases the AUC and C .... of atazanavir [see Clinical Pharmacology (12.3)]. When coadministered with

be taken, separated by 12 hours from dolutegravir, lamivudine, and tenofovi

disoproxil fumarate tablets.

dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets, it is recommended that atazanavir 300 mg is given with ritonavir 100 mg. Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets should not be coadministered with atazanavir without Lopinavir/ritonavir, atazanavir coadministered with ritonavir, and darunavir coadministered with ritonavir have been shown to increase tenofovir concentrations/see Clinical Pharmacology/1/2.3/j. Tenofovir disporpoxil fumarate is a substrate of P-qlycoprotein (Pgp) and breast cancer resistance protein (BCRP) transporters. When tenofovir disporpoxil fumarate is administered with an inhibitor of these transporters, an increase in absorption may be observed. Patients receiving dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets concomitantly with lopinavir/ritonavir, ritonavir-boosted atazanavir, or ritonavir-boosted darunavir should be monitored for tenofovir disoproxil fumarate-associated adverse reactions. Dolutegravir, lamivudine and tenofovir disoproxil 7.6 Hepatitis C Antiviral Agents

Coadministration of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and ledipasvir/sofosbuvir (HARVONI) or sofosbuvir/velpatasvir (EPCLUSA) has been shown to increase tenofovir exposure (see Clinical Pharmacology (12.3)). In patients receiving dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets concomitantly with sofosbuvir/velpatasvir, monitor for adverse reactions associated with tenofovir disoproxil fumarate. In patients receiving dolutegravir, lamivudine and tenofovir disoproxil furnarate tablets concomitantly with ledipasvir/sofosbuvir without an HIV-1 protease inhibitor/coblicistat combination, monitor for adverse reactions associated with tenofovir disoproxil furnarate. In patients receiving dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets concomitantly with ledispasvir/sofosbuvir and an HIV-1 protease inhibitor/ritonavir or an HIV-1 protease inhibitor/cobicistat combination, consider an alternative HCV or intiretroviral therapy, as the safety of increased tenofovir concentrations in this setting has not been established. If coadminis s necessary, monitor for adverse reactions associated with tenofovir disoproxil fumarate. 7.7 Drugs Affecting Renal Function Since tenofovir is primarily eliminated by the kidneys [see Clinical Pharmacology (12.3)], coadministration of dolutegravir, lamivudine

and tenofovir disoproxil fumarate tablets with drugs that reduce renal function or compete for active tubular secretion may increase serum concentrations of tenofovir and/or increase the concentrations of other renally eliminated drugs. Some examples include, but are not limited to, adefovir dijovaxil, clofovir, acyclovir, valeyclovir, apanciclovir, valganciclovir, aminoglycosides (e.g., gentamicin), and high-dose or multiple NSAIDs/see Warnings and Precautions (5.5)/. 7.8 Drugs Inhibiting Organic Cation Transporters

Lamivudine, a component of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets, is predominantly eliminated in the urine by active organic cationic secretion. The possibility of interactions with other drugs administered concurrently should be considered, particularly when their main route of elimination is active renal secretion via the organic cationic transport system (e.g., trimethoprim) (see Clinical Pharmacology (17.23)). No data are available regarding interactions with other drugs that have renal clearance mechanisms similar to that of lamivudine. 7.9 Sorbitol Coadministration of single doses of lamivudine and sorbitol resulted in a sorbitol dose-dependent reduction in lamivudine exposures. When possible, avoid use of sorbitol-containing medicines with lamivudine (see Clinical Pharmacology (12.3)). 8 USE IN SPECIFIC POPULATIONS 8.1 Pregnancy

Pregnancy Category C. There are no adequate and well controlled trials in pregnant women. Reproduction studies with the components of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets have been performed in animals (see Dolutegravir, Abacavir, and Lamivudine sections below). Animal reproduction studies are not always predictive of human response. Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets should be used during pregnancy only if the potential benefit outweigh the risks. Dolutegravir: Reproduction studies performed in rats and rabbits at doses up to 50 times the human dose of 50 mg once daily have revealed no evidence of impaired fertility or harm to the fetus due to dolutegravir. Oral administration of dolutegravir to pregnant rats at doses up to 1,000 mg per kg daily, approximately 50 times the 50 mg once-daily human clinical exposure based on AUC, from days 6 to 17 of gestation did not elicit maternal toxicity, developmental toxicity, or teratogenicity. Oral administration of dolutegravir to pregnant rabbits at doses up to 1,000 mg per kg daily, approximately 0.74 times the 50 mg once-daily human clinical exposure based on AUC, from days 6 to 18 of gestation did not elicit developmental toxicity or teratogenicity. In

rabbits, maternal toxicity (decreased food consumption, scant/no feces/urine, suppressed body weight gain) was observed at 1,000 times the human exposure for a dose of 300 mg. No evidence of teratogenicity due to laminuding placenta. Reproduction studies times the human exposure for a dose of 300 mg. No evidence of teratogenicity due to laminudine was observed. Evidence of early embryolethality was seen in the rabbit at exposure levels similar to those observed in humans, but there was no indication of this effect in the rat at plasma levels up to 32 times those in humans.

\*\*Tenofoviri Disponsivi Exposure 1.0.\*\*

\*\*Tenofoviri Disponsivi Exposure 1.0 *Lamivudine:* Studies in pregnant rats showed that lamivudine is transferred to the fetus through the placenta. Reproduction studies Tenofovir Disoproxil Fumarate: Reproduction studies have been performed in rats and rabbits at doses up to 14 and 19 times the human dose based on body surface area comparisons and revealed no evidence of impaired fertility or harm to the fetus due to 8.3 Nursing Mothers The Centers for Disease Control and Prevention recommend that HIV-1-infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV-1 infection. Because of both the potential for HIV-1 transmission and the potential for serious adverse reactions in nursing infants, instruct

Studies in lactating rats and their offspring indicate that dolutegravir was present in rat milk. It is not known whether dolutegravir is Lamivudine is excreted in human breast milk Tenofovir Disoproxil Fumarate Samples of breast milk obtained from five HIV-1 infected mothers in the first post-partum week show that tenofovir is secreted in human milk

8.4 Pediatric Use  $Dolute gravir, lamivudine \ and \ tenofovir \ disoproxil \ furnarate \ tablets \ should \ only \ be \ administered \ to \ patients \ with \ a \ body \ weight \ of \ at \ least \ 40 \ kg.$ Clinical trials of dolutegravir, lamivudine, or tenofovir disoproxil fumarate did not include sufficient numbers of subjects aged 65 and older to determine whether they respond differently from younger subjects. In general, caution should be exercised in the administration of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets in elderly patients reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy /see Clinical

harmacology (12.3)]. 8.6 Patients with Impaired Renal Function Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are not recommended for patients with creatinine clearance less than 50 mL per min because dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are a fixed-dose combination and the dosage of the individual components cannot be adjusted. If a dose reduction of lamivudine or tenofovir disoproxil fumarate, two components of dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets, is required for patients with creatinine clearance less than 50 mL per min, then the individual components should be used /see Clinical Pharmacology (12.3)]. 8.7 Patients with Impaired Hepatic Function

Dolutegravir No clinically important pharmacokinetic differences between subjects with moderate hepatic impairment and matching healthy subjects were observed. No dosage adjustment is necessary for patients with mild to moderate hepatic impairment (Child-Pugh Score A or B). The effect of severe hepatic impairment (Child-Pugh Score C) on the pharmacokinetics of dolutegravir has not been studied. fore, dolutegravir is not recommended for use in patients with severe hepatic impairment (see Clinical Pha There is no known specific treatment for overdose with dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets. If overdose occurs, the patient should be monitored and standard supportive treatment applied as required. Dolutegravir As dolutegravir is highly bound to plasma proteins, it is unlikely that it will be significantly removed by dialysis

Because a negligible amount of lamivudine was removed via (4-hour) hemodialysis, continuous ambulatory peritoneal dialysis, and automated peritoneal dialysis, it is not known if continuous hemodialysis would provide clinical benefit in a lamivudine overdose Limited clinical experience at doses higher than the therapeutic dose of tenofovir disoproxil fumarate 300 mg is available. In Study 901, 600 mg tenofovir disoproxil fumarate was administered to 8 subjects orally for 28 days. No severe adverse reactions were reported. The effects of higher doses are not known. Tenofovir is efficiently removed by hemodialysis with an extraction coefficient of approximately 54%. Following a single 300 mg dose of tenofovir disoproxil fumarate, a 4-hour hemodialysis session removed approximately 10% of the administered tenofovir dose. 11 DESCRIPTION Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are for oral administration. Each film coated tablet contains 50 mg of Dolutegravir (equivalent to 52.6 mg of dolutegravir sodium), 300 mg of Lamivudine USP, and 300 mg of Tenofovir disoproxil fumarate (equivalent to 245 mg of tenofovir disoproxil). In addition, each tablet contains the following inactive ingredients: croscarmellose sodium, hydroxypropy cellulose, magnesium stearate, mannitol, microcrystalline cellulose, povidone, sodium starch glycolate, and sodium stearyl fumarate. The tablets have an orange film coat which contains iron oxide red, iron oxide yellow, polyethylene glycol, polyvinyl alcohol, talc, and titanium dioxide. Dolutegravir, as dolutegravir sodium, an HIV INSTI. The chemical name of dolutegravir sodium is Sodium (4R, 12as)-9-(12.4 difluorobenzyl)carbamoyl)-4-methyl-6,8-dioxo-3,4,6,8, 12,12a-hexahydro-2H-pyridol $1^2$ ,  $2^2$ , 4, 5] pyrazino [2,1-b] [1,3]oxazin -7 odate. The empirical formula is  $C_{\rm e}H_{\rm in}F_{\rm in}N_{\rm in}0$ , and the molecular weight is 441.37 g per mol. It has the following structural formula:

Dolutegravir sodium is an off-white or white to light yellow color powder and is very slightly soluble in methanol and practically insoluble in water. Lamivudine (also known as 3TC) is a synthetic nucleoside analogue with activity against HIV-1 and HBV. The chemical name of lamivudine USP is 2(1H) - Pyrimidinone, 4-amino-1-12- (hydroxy methyl)-1.3-oxathio-lan-5-yll, [2R-cis}- Lamivudine is the (-) enantioner of a dideoxy analogue of cytidine. Lamivudine has also been referred to as (-)2-(eloxy-3'-thiacytidine. It has a molecular formula of  $C_1H_1,N_1O_5$ 3 and a molecular weight of 229.26 g per mol. It has the following structural formula:

Lamivu dine is a white or almost white powder and is soluble in water, sparingly soluble in methanol and slightly soluble in ethanol.Tenofovir disoproxil furnarate is a nucleotide reverse transcriptase inhibitor. The chemical name of tenofovir disoproxil furnarate is 9-  $[(\beta)-2]$ -Bis $[(\beta)-2]$ 

ČH₃ Ó O O HO₂C Tenofovir disoproxil fumarate is a white to an off-white crystalline powder. Sparingly soluble in ethanol and in methanol. 12 CLINICAL PHARMACOLOGY 12.1 Mechanism of Action olutegravir, lamivudine, and tenofovir disoproxil fumarate are HIV-1 antiviral agents /see Microbiology (12.4)/.

12.2 Pharmacodynamics Effects on Electrocardiogram: A thorough QT trial has been conducted for dolutegravir. Neither the effects of lamivudine nor tenofovir disoproxil fumarate as single entities or the combination of dolutegravir, lamivudine and tenofovir disoproxil fumarate on the QT interval have been evaluated In a randomized, placebo-controlled, cross-over trial, 42 healthy subjects received single-dose oral administrations of placebo, dolutegravir 250 mg suspension (exposures approximately 3-fold of the 50 mg once-daily dose at steady state), and moxifloxacin 400 mg (active control) in random sequence. After baseline and placebo adjustment, the maximum mena OTc change based on Friderica correction method (QTcF) for dolutegravir was 2.4 msec (1-sided 95% upper Ct: 4.9 msec). Dolutegravir did not prolong the Effects on Renal Function. The effect of dolutegravir on renal function was evaluated in an open-label, randomized, 3-arm, parallel, placebo-controlled trial in healthy subjects (n = 37) who received dolutegravir 50 mg once daily (n = 12), dolutegravir 50 mg twice daily (n = 13), or placebo once daily (n = 12) for 14 days. A decrease in creatinine clearance, as determined by 24-hour urine collection, was observed with both doses of dolutegravir after 14 days of treatment in subjects who received 50 mg once daily [9% decrease]. Neither dose of dolutegravir had a significant effect on the actual glomerular filtration rate (determined by the clearance of probe drug, johexol) or effective renal plasma flow (determined by the clearance of probe drug, para-amino hippurate) compared with the placebo.

12.3 Pharmacokinetics Dolutenravir, Lamiyudine and Tenofovir Disonroxil Fumarate Tablets The mean systemic exposures of dolutegravir, lamivudine and tenofovir disoproxil fumarate from the Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets were comparable to that from TIVICAY tablets of Vii USA (containing lamidudine 300 mg), and VIREAD tablets of Vii USA (containing tenofovir disoproxil fumarate 300 mg), respectively, when single doses were administered to healthy subjects under fasted conditions. Dolutegravir: Following or al administration of dolutegravir, peak plasma concentrations were observed 2 to 3 hours postdose. With once-daily dosing, pharmacokinetic steady state is a chieved within approximately 5 days with average accumulation ratios for AUC, C..., and C.3, ranging from 1.2 to 1.5. Dolutegravir is a Pylocyprotein substrate in viro. The absolute bioavailability of dolutegravir has not been established. Dolutegravir is highly bound (greater than or equal to 98.9%) to human plasma proteins based on in vivo data and binding is independent of plasma concentration of dolutegravir. The apparent volume of distribution (VdIF) following 50-mg once-daily administration is estimated at 17.4 L based on a population pharmacokinetic analysis. Dolutegravir is primarily metabolized via UGT1A1 with some contribution from CYP3A. After a single oral dose of [<sup>14</sup>C] dolutegravir Dolutegravir is primanily metabolized via UGT 1A1 with some contribution from CYP3A. After a single oral dose of 1°Cl dolutegravir, 53% of the total oral dose is excreted unchanged in the feces. Thirty-one percent of the total oral dose is excreted in the urine, represented by an ether glucuronide of dolutegravir (18.9% of total dose), a metabolite formed by oxidation at the benzylic carbon (3.0% of total dose), and its hydrolytic N-dealkylation product (3.6% of total dose). Renal elimination of unchanged drug was less than 1% of the dose. Dolutegravir has a terminal half-life of approximately 14 hours and an apparent clearance (CLIF) of 1.0 L per hour based on population pharmacokinetic analyses. The pharmacokinetic properties of dolutegravir have been evaluated in healthy adult subjects and HIV-1-infected adult subjects. e to dolutegravir was generally similar between healthy subjects and HIV-1-infected subje

50 mg Once Daily Geometric Mean (%CV) Parameter AUC<sub>(0.24)</sub> (mcg•h/mL) C\_i (mcg/mL) spinal Fluid (CSF): In 12 treatment-naïve subjects on dolutegravir 50 mg daily plus abacavir/lamivudine, the mediar ravir concentration in CSF was 13.2 ng per mL (range: 3.74 ng per mL to 18.3 ng per mL) 2 to 6 hours postdose after 16 weeks ment. The clinical relevance of this finding has not been established. of treatment. The clinical relev Polymorphisms in Drug-Metabolizing Enzymes: In a meta-analysis of healthy subject trials, subjects with UGT1A1 (n = 7) genotypes conferring poor dolutegravir metabolism had a 32% lower clearance of dolutegravir and 46% higher AUC compared with subjects with genotypes associated with normal metabolism via UGT1A1 (n = 41). Lamivudine: After multiple dose oral administration of lamivudine 300 mg once daily for 7 days to 60 healthy subjects, steady-state ... (C.....) was 2.04 ± 0.54 mcg per mL (mean ± SD) and the 24 hour steady state AUC (AUC,...) was 8.87 ± 1.83 mcg • hour per m  $L_{\rm m,L}|U_{\rm m,L}|Was 2..04 \pm 0.54$  mcg per mt. (mean  $\pm$  SU) and the 24 nour steady state AUU (AUU<sub>24.1</sub>) was 8.87  $\pm$  1.83 mcg-nour per mt. Binding to plasma protein is low. Approximately 70% of an intravenous dose of lamivudine is recovered as unimped drug in the urine by active organic cationic secretion. Metabolism of lamivudine is a minor route of elimination. In humans, the only known metabolite is the trans sulfoxide metabolite (approximately 5% of an oral dose after 12 hours). In most single-dose trials in HIV-1-infected subjects, HBV-infected subjects, You healthy subjects with serum sampling for 24 hours after dosing, the observed mean elimination half-life ( $t_{\rm s}$ ) ranged from 5 to 7 hours. In HIV-1-infected subjects, total clearance was 398.5  $\pm$  69.1 mL per min (mean  $\pm$  SD). **Tenofovir Disoproxil Fumarate:** The pharmacokinetic properties of tenofovir disoproxil fumarate are summarized in Table 7. Following oral administration of tenofovir disoproxil fumarate, maximum tenofovir serum concentrations are achieved in  $1.0 \pm 0.4$  hour. Less than 0.7% of tenofovir binds to human plasma proteins in wirro and the binding is independent of concentration over the range of 0.01 to 25 mcg /ml. The volume of distribution at steady-state is  $1.3\pm0.6$  L/kg and  $1.2\pm0.4$  L/kg, following intravenous administration of tendroivi 1.0 mg/s and 3.0 mg/kg, Approximately 70 to 80% of the intravenous osc of tendroivi is recovered as unchanged drug in the urine. Tendroiv is eliminated by a combination of glomerular filtration and active tubular secretion. Following a first of the contraction of the contracti

Effects of Food on Oral Absorption of Dolutegravir, lamivudine and tenofovir disoproxil fumarate: The effect of food on Specific Populations Patients with Hepatic Impairment: Dolutegravir: Dolutegravir is primarily metabolized and eliminated by the liver. In a trial comparing 8 subjects with moderate hepatic impairment (Child-Pugh Score B) with 8 matched healthy controls, suposure of doluterparir from a single 50 mg dose was similar between the 2 groups. No dosage adjustment is necessary for patients with mild to moderate hepatic impairment (Child-Pugh Score A or B). The effect of severe hepatic impairment (Child-Pugh Score C) on the pharmacokinetics of dolutegravir has not been studied. Therefore, dolutegravir is not recommended for use in patients with sev Lamivudine: The pharmacokinetic properties of lamivudine have been determined in adults with impaired hepatic function Pharmacokinetic parameters were not altered by diminishing hepatic function. Safety and efficacy of lamivudine have not beer established in the presence of decompensated liver disease. Tenofovir Disoproxil Fumarate: The pharmacokinetics of tenofovir following a 300 mg single dose of tenofovir disoproxil fumarate have been studied in non-HIV infected subjects with moderate to severe hepatic impairment. There were no substantial alterations in tenofovir pharmacokinetics in subjects with hepatic impairment compared with unimpaired subjects. No change in tenofovir disoproxil fumarate dosing is required in patients with hepatic impairment. HBV/HCV Co-infection: Dolutegravir: Population analyses using pooled pharmacokinetic data from adult trials indicated no clinically relevant effect of HCV co-infection on the pharmacokinetics of dolutegravir. There were limited data on HBV co-infection. Patients with Renal Impairment: Because dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are a fixed-dose tablet and cannot be dose adjusted, dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets are not recommended in patients requiring dosage adjustment or patients with renal impairment/see Dosage and Administration (2.3)]. Male and Female Patients: There are no significant or clinically relevant gender differences in the pharmacokinetics of the individual components (dolutegravir, lamivudine or tenofovir disoproxil fumarate) based on the available information that was analyzed for each Racial Groups: <u>Dolutegravir and Lamivudine:</u> There are no significant or clinically relevant racial differences in the pharmacokinetics of dolutegravir or lamivudine based on the available information that was analyzed for each of the individual components. Tenofovir <u>Disoproxil Fumrate</u>: There were insufficient numbers from racial and ethnic groups other than Caucasian to adequately determine potential pharmacokinetic differences among these populations. Geriatric Patients: Dolutegravir: Population analyses using pooled pharmacokinetic data from adult trials indicated age had no clinically relevant effect on the pharmacokinetics of dolutegravir. tamivudine and Tenofovir Disoproxil Fumarate: The pharmacokinetics of lamivudine or tenofovir disoproxil fumarate have not been studied in subjects older than 65 years. Pediatric Patients: Dolutegravir, Iamivudine and tenofovir disoproxil fumarate tablets should not be administered to pediatric patients weighing less than 40 kg (88 lbs). Dolutegravir and Lamivudine: The pharmacokinetics of the combination of dolutegravir and lamivudine in pediatric subjects have not

Tenofovir Disoproxil Fumarate: Steady-state pharmacokinetics of tenofovir were evaluated in 8 HIV-1 infected pediatric subjects (12 to less than 18 years). Mean ± SD C<sub>m.</sub> and AUC<sub>m.</sub> are 0.38 ± 0.13 meg/ml. and 3.39 ± 1.22 mcg•hr/ml, respectively. Tenofovir exposure achieved in these pediatric subjects receiving oral daily doses of tenofovir disoproxil fumarate 300 mg was similar to exposures achieved in adults receiving once-daily doses of tenofovir disoproxil fumarate 300 mg. Assessment of Drug Interactions: Dosing recommendations as a result of established and other potentially significant drug-drug interactions with dolutegravir are provided in Section 7.3/see Drug Interactions (7)].

The number of subjects represents the maximum number of subjects that were evaluated.

Based on in vitro study results, lamivudine at therapeutic drug exposures is not expected to affect the pharmacokinetics of drugs that are Based on *m wiro* study results, namivudine at therapeutic drug exposures is not expected to affect the pharmacokinetics of drugs that are substrates of the following transporters: organic anior transporter polypeptide 1813 (DATPE1813), breast cancer resistance protein (BCRP), P-glycoprotein (P-gp), multidrug and toxin extrusion protein 1 (MATE1), MATE2-X, organic cation transporter 1 (DCT1), LOT2, or COT3. Effect of Other Agents on the Pharmacokinetics of Lamwindine: Lamivudine is a substrate of MATE1, MATE2-X, and DCT2 in vitro. Lamivudine is a substrate of MATE1, MATE2-X, and DCT2 in vitro. Lamivudine is a substrate of MATE1, MATE2-X, and DCT2 in vitro. Lamivudine is a substrate of MATE1, MATE3-X, and DCT2 in vitro. Lamivudine is a substrate of MATE1, M Interferon Alfa: There was no significant pharmacokinetic interaction between lamivudine and interferon alfa in a trial of 19 healthy male subjects (see Warnings and Precautions (5.6)). Studjects (see warmings and reconstruction).

Ribavirin: In vitro data indicate ribavirin reduces phosphorylation of lamivudine, stavudine, and zidovudine. However, no pharmacokinetic (e.g., 1814-1816).

HIV-1/HCV plasma concentrations or intracellular triphosphorylated active metabolite concentrations) or pharmacodynamic (e.g., loss of HIV-1IHČV virologie suppression) interaction was observed when libavirin and laminudure (n = 10), or adovudine (n = 6) were coadministered as part of a multi-drug regimen to the VII-IHCV co-infected subjects (see Warmings and Precautions (5.6) Precautions (5.0). Sorbitol (Excipient): Lamivudine and sorbitol solutions were coadministered to 16 healthy adult subjects in an open-label, randomized sequence, 4-period, crossover trial. Each subject received a single 300-mg does of lamivudine oral solution above or coadministered with a single dose of 3.2 grams, 10.2 grams, or 13.4 grams of sorbitol in solution. Coadministration of lamivudine with sorbitol resulted in dose-dependent decreases of 20%, 39%, and 44% in the AUC<sub>0.30</sub>, 14%, 32%, and 36% in the AUC<sub>0.07</sub> and 28%, 52%, and 55% in the C<sub>ox</sub> of lamivudine. Trimethoprim/Sulfamethoxazole: Lamivudine and TMP/SMX were coadministered to 14 HIV-1-positive subjects in a single-center, open label, randomized, crossover trial. Each subject received treatment with a single-center open. Immethoprim Surfamethoxazone: Lamvudine and TMM/SMX were coadministered to 14 HIV1-positive subjects in a single-center, open-label, randomized, crossover trial. Each subject received treatment with a single 300 mg dose of lamivudine and TMP 160 mg/SMX 800 mg once a day for 5 days with concomitant administration of lamivudine 300 mg with the fifth dose in a crossover design. Coadministration of TMP/SMX with lamivudine resulted in an increase of 43% ± 23% (men ± 50) in lamivudine AUC ∞, a decrease of 29% ± 13% in lamivudine oral clearance, and a decrease of 30% ± 36% in lamivudine renal clearance. The pharmacokinetic properties of TMP and SMX were not altered by coadministration with lamivudine. There is no information regarding the effect on lamivudine pharmacokinetics of higher doses of TMP/SMX such as those regardint reas PCP.

Tendravir Dispraxif Fumarate: At concentrations substantially higher ( ~ 300-fold) than those observed in vivo, tenofovir did not inhibit in vitro drug metabolism mediated by any of the following human CVP isoforms: CYP3A4, CYP2D6, CYP2C9, or CYP2E1. However, a small (6%) but statistically significant reduction in metabolism of CYP1A substrate was observed. Based on the results of in vitro experiments and the known elimination pathway of tenofovir, the potential for CYP mediated interactions involving tenofovir with other medicinal Tenofovir disoproxil fumarate has been evaluated in healthy volunteers in combination with other antiretroviral and potential concomtant drugs Tables 10 and 11 summarize pharmacokinetic effects of coadministered drug on tenofovir pharmacokinetics and effects of tenofovir disoproxi fumarate on the pharmacokinetics of coadministered drug. Coadministration of tenofovir disoproxil fumarate with didanosine results in changes in the pharmacokinetics of tidanosine results in changes in the pharmacokinetics of tidanosine that may be of clinical significance. Concommitant dosing of tenofovir disoproxil fumarate with dimanosine significantly increases the C<sub>ma</sub> and AUC of didanosine. When didanosine 250 mg enteric-coated capsules were administered with tenofovir disoproxil fumarate, systemic exposures of didanosine were similar to those seen with the 400 mg enteric-coated capsules alone under faster conditions (Table 11). The mechanism of this interaction is unknown. No clinically significant drug interactions have been observed between tenofovir disoproxil fumarate and efavirenz, methadone, nelfinavir, oral contraceptives, ribavirin, or sofosbuvir.

Coadministration of tenofovir disoproxil furnarate with didanosine results in changes in the pharmacokinetics of didanosine that may be of clinical significance. Concomitant dosing of tenofovir disoproxil furnarate with didanosine enteric-coated capsules significantly increases the C<sub>m</sub> and AUC of didanosine. When didanosine 250 mg enteric-coated capsules were administered with tenofovir disoproxil furnarate, systemic exposures of didanosine verse similar to those seem with the 400 mg enteric-coated capsules alone under fasted conditions. The mechanism of this interaction is unknown. See Drug Interactions (7.4) regarding use of didanosine with tenofovir disoproxil furnarate. Mechanism of Action: Dolutegravir: Dolutegravir inhibits HIV integrase by binding to the integrase active site and blocking the strand transfer step of retroviral deoxyribonucleic acid (DNA) integration which is essential for the HIV replication cycle. Strand transfer biochemical assays using purified HIV-1 integrase and pre-processed substrate DNA resulted in IC, values of 2.7 nM and 12.6 nM. Lamivudine: Lamivudine is a synthetic nucleoside analogue. Intracellularly, lamivudine is phosphorylated to its active 5'-triphosphate metabolite lamivudine triphosphate (3TC-TP). In principal mode of action of 3TC-TP is inhibition of HIV-1 reverse transcriptase (RT) via DNA chair termination after incomposition of the underside analogue. termination after incorporation of the nucleotide analogue. Transform Dissoproxil Fumarate: Tenofovir disoproxil fumarate is an acyclic nucleoside phosphonate diester analog of adenosine monophosphate. Tenofovir disoproxil fumarate requires initial diester hydrolysis for conversion to tenofovir and subsequent phosphorylations by cellular enzymes to form tenofovir diphosphate, an obligate chain terminator. Tenofovir diphosphate and the activity of HIV-1 reverse transcriptase by competing with the natural substrate deoxyadenosine 5-tribosphate and, after incorporation into DNA, by DNA chain termination. Tenofovir diphosphate and, after incorporation into DNA, by DNA chain termination. Tenofovir diphosphate is a weak inhibitor of mammalian DNA polymerases  $\alpha$ ,  $\beta$ , and mitochondrial DNA polymerase  $\gamma$ . weak inhibitor of mammalian DNA polymerases  $\alpha$ ,  $\beta$ , and mitochondrial DNA polymerase  $\gamma$ .

Antiviral Activity in Cell Culture: Dolutegravir: Dolutegravire in the description of the property of the property of the control of the property of the property of the control of the property Cells. Tenofovir Disproxil Fumarate: The antiviral activity of tenofovir against laboratory and clinical isolates of HIV-1 was assessed in lymphoblastoid cell lines, primary monocytelmacrophage cells and peripheral blood lymphocytes. The EC<sub>ss</sub> (50% effective concentration) values for tenofovir were in the range of 0.04 µM to 8.5 µM. In drug combination studies, tenofovir was not antagonistic with nucleoside reverse transcriptase inhibitors (abacavir, didanosine, lamivudine, stavudine, zofactiabine, zidovodine), non-nucleoside reverse transcriptase inhibitors (delavirdine, effouriem), and protease inhibitors (amprenavir, indinavir, nelfinavir, ritonavir, saquinavir). Tenofovir displayed antiviral activity in cell culture against HIV-1 clades A, B, C, D, E, F, G, and O (EC<sub>ss</sub> values ranged from 0.5 µM to 2.2 µM) and strain specific activity against HIV-2 (EC<sub>ss</sub> values ranged from 1.6 µM to 5.5 µM). Antiviral Activity in Combination with Other Antiviral Agents: Neither dolutegravir nor lamivudine were antagonistic to all tested anti-HIN Resistance in Cell Culture: Dolutegravir: Dolutegravir-resistant viruses were selected in cell culture starting from different wild-type HIV-1 strains and clades. Amino acid substitutions E920, G118R, S153F or Y, G193E or R263K emerged in different passages and conferred decreased susceptibility to dolutegravir of up to 4-fold. HIV-1 strains resistant to both hairvidine and idvoludin have been isolated from subjects. Susceptibility of clinical isolates to lamivudine and zidovudine was monitored in controlled clinical trials. In subjects receiving lamivudine monotherapy or combination therapy with lamivudine and zidovudine was monitored in controlled clinical trials. In subjects receiving lamivudine monotherapy or combination therapy with lamivudine plus zidovudine, HIV-1 isolates from most subjects became phenotypically and genotypically resistant to lamivudine within 12 weeks.

\*\*Tenofovir Disoproxii Fumarate: HIV-1 isolates with reduced susceptibility to tenofovir have been selected in cell culture. These viruses expressed a K66R substitution in reverse transcriptase and showed a 2-to 4-fold reduction in susceptibility to tenofovir. In addition, a K70E substitution in HIV-1 reverse transcriptase has been selected by tenofovir and results in low-level reduced susceptibility to tenofovir.

reverse transcriptase has been selected by tenofovir and results in low-level reduced susceptibility to tenofovir.

In Study 903 of treatment-naïve subjects (tenofovir disoproxil fumarate + lamivudine + efavirenz, yenotypic analyses of isolates from subjects with virologic failure through Week 144 showed development of efavirenz and lamivudine resistance-associated substitutions to occur most frequently and with no difference between the treatment arms. The K6BR substitution occurred in 8147 (17%) of analyzed patient isolates in the tenofovir disoproxil fumarate arm and in 2149 (49%) of analyzed patient isolates the stavudine arm. Of the eight subjects whose virus developed K6BR in the tenofovir disoproxil fumarate arm through 144 weeks, seven occurred in the first 48 weeks of treatment and one at Week 98. One patient in the tenofovir disoproxil fumarate arm developed the K70E substitution in the virus. Other substitutions resulting in resistance to tenofovir disoproxil fumarate were not identified in this trial. In Study 934 of treatment-naïve subjects (tenofovir disoproxil fumarate + EMTRIVA + efavirenz versus zidovudine (AZT)|lamivudine (3TC) -efavirenz), genotypic analysis performed on HIV-1 isolates from all confirmed virologic failure subjects with greater than 400 copies/ml. of HIVefavirenzi, genotypic analysis performed on HIV-1 isolates from all confirmed virologic failure subjects with great than 4UL copies. MI of HIV-1 RIVA at Week 144 or early discontinuation showed development of elavirenz resistance-associated substitutions current most frequently and was similar between the two treatment arms. The MI 94V substitution, associated with resistance to EMTRIVA and unaution, was observed in [21] analyzed subject isolates in the incorpor disporporal manaret arms. Third MI propared in 10(29 analyzed subject isolates in the racidovudinel[amixudine] group. Through 144 weeks of Study 934, no subjects have developed a detectable K65R substitution in their HIV-1 as analyzed through standard genotypic analysis. Cross-Resistance: Dolutegravir: The single INSTI-resistance substitutions T66K, I151L, and S153Y conferred a greater than 2-fold decrease i Cross-nesistance: Dimicegiatur: The simple most intestinatine substitutions 100A, 1131, and s133 counterful a greater than 2-100 decrease in doubtegrariar susceptibility (range: 2.3-fold to 3.6-fold from reference). Combinations of multiple substitutions 166KL/174M, E920/IN155H, 6140C(0148R, 6140S)(0148R, 614 140S/Q148R showed 8.5-fold and 17-fold decreases in dolutegravir susceptibility, respectively Lamivudine: Cross-resistance has been observed among nucleoside reverse transcriptase inhibitors (NRTIs). Lamivudine-resistant HIV-1 mutants were cross-resistant in cell culture to didanosine (ddl). Cross-resistance is also expected with abacavir and emtricitabine as these select M184V Tendowir Disaproxil Fumarate: Cross-resistance among certain reverse transcriptase inhibitors has been recognized. The K65R and K70E substitutions selected by tendovir are also selected in some HIV-1 infected subjects treated with abacavir or didanosine. HIV-1 isolates with this bustitution also show reduced susceptibility to entricitable and almividine. Therefore, cross-resistance among these draw gray occur in patients whose virus harbors the K65R or K70E substitution. HIV-1 isolates from subjects (N = 20) whose HIV-1 expressed a mean of three zidovudine-associated reverse transcriptase substitutions (M41L, D67N, K70R, L210W, T215Y/F, or K2190/E/N), showed a 3.1-fold decrease in the susceptibility to tendovir. In Studies 902 and 907 conducted in treatment-experienced subjects (tenofoxir disporaxil fumarate + Standard Background Therany (SRT compared to Placebo + SBT), 14/304 (5%) of the tenofovir disoproxil furmarate-treated subjects with virologic failure through Week 96 had greate than 1.4-fold (median 2.7-fold) reduced susceptibility to tenofovir. Genotypic analysis of the baseline and failure isolates showed the developmen of the K6BR substitution in the HIV-1 reverset ranscriptase gene. The virologic response to tendrovir disproxit fumorate therapy has been evaluated with respect to baseline viral genotype (N = 222) in treatment experienced subjects participating in Studies 902 and 907. In these clinical trials, 94% of the participants evaluated had baseline HIV-1 isolate expressing at least one NRTI substitution. Virologic responses for subjects in the genotype substudy were similar to the art of the participants and the property of the participants of the participants and the property of the participants of the participants and the property of the participants are the property of the participants of the participants are the participant of the participants are the participants of the participants of the participants are the participant of the participants are the participant of the participants of the participants of the participants of the participants are the participant of the participants o expressing at least one NRTI substitution. Virologic responses for subjects in the genotype substudy were similar to reveal train results. Several exploratory analyses were conducted to evaluate the effect of specific substitutions and substitutional patterns on virologic outcome. Because of the large number of potential comparisons, statistical testing was not conducted. Varying degrees of cross-resistance of tendoric disoproxil fumerate to preexisting zidovodine resistance-associated substitutions (M41L, D87N, K70R, 1210N, 175F), or K2190LFIN) were observed and appeared to depend on the type and number of specific substitutions. Tendorivir disoproxil fumerate-treated subjects whose HIV-texpressed time error more zidovodine resistance-associated substitutions that included either the M41 Lot 210W restranscriptase substitutions showed reduced responses to tendorivir disoproxil fumerate therapy. However, these responses were still improved compared with placebo. The presence of the BoTN, K70R, T219TF, or K219QLFIN substitution did not appear to affect responses to tendorivir disoproxil fumerate therapy. Subjects whose virus expressed an L74V substitution without zidovudine resistance associated substitutions (N – 8) had reduced response to nendorive climated that are available for subjects whose virus expressed an L74V substitution (N – 2), or 189 insertion (N – 4), all of whom had a reduced response. In the protocol defined analyses, virologic response to tenofovir disoproxil fumarate was not reduced in subjects with HIV-1 that expres abacavir/emtricitabine/lamivudine resistance-associated M184V substitution. HIV-1 RNA responses among these subjects were durable t Studies 902 and 907 Phenotypic Analyses: Phenotypic analysis of baseline HIV-1 from treatment-experienced subjects (N = 100) demonstrated a correlation between baseline susceptibility to tenofovir disoproxil fumarate and response to tenofovir disoproxil fumarate subsectibility. summarizes the HIV-1 RIAM response by baseline tenofovir disoproxil fumarate susceptibility.

Average HIV-1 RNA change from baseline through Week 24 (DAVG<sub>at</sub>) in log<sub>so</sub> copies/mL. NONCLINICAL TOXICOLOGY 13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

13.1 Carcinogenesis, Mutagenesis, impairment or retruity

Carcinogenesis: Dolutegravir. Two year carcinogenicity studies in mice and rats were conducted with dolutegravir. Mice were administered doses of up to 500 mg per kg, and rats were administered doses of up to 500 mg per kg, and rats were administered doses of up to 50 mg per kg. In mice, no significant increases in the incidence of drug-related neoplasms were observed at the highest doses tested, resulting in dolutegravir AUC exposures approximately 14-fold higher than those in humans at the recommended dose of 50 mg twice daily. In rats, no increases in the incidence of drug-related neoplasms were dat the highest dose tested, resulting in dolutegravir AUC exposures 10-fold and 15-fold higher in males and females, respectively, than those in humans at the recommended date on £50 mg twice daily. amivudine: Long-term carcinogenicity studies with lamivudine in mice and rats showed no evidence of carcinogenic potential at expo-imes (mice) and 57 times (rats) the human exposures at the recommended dose of 300 mg. Tenofovir Disoproxil Fumarate: Long-term oral carcinogenicity studies of tenofovir disoproxil fumarate in mice and rats were carried out at Exposures up to approximately 16 times (mice) and 5 times (rats) those observed in humans at the therapeutic dose for HIV-1 infection. At the high dose in female mice, liver adenomas were increased at exposures 16 times that in humans. In rats, the study was negative for carcinogenic findings at exposures up to 5 times that observed in humans at the therapeutic dose. Mutagenesis: Dolutegravir: Dolutegravir was not genotoxic in the bacterial reverse mutation assay, mouse lymphoma assay, or in the in vivo rodent micronucleus assay. Lamivudine: Lamivudine was mutagenic in an L5178Y mouse lymphoma assay and clastogenic in a cytogenetic assay using cultured human lymphocytes. Lamivudine was not mutagenic in a microbial mutagenicity assay, in an in vitro cell transformation assay, in a rat micronucleus test, in a rat bone marrow cytogenetic assay, and in an assay for unscheduled DNA synthesis in rat liver. Tenofovir Disoproxil Fumarate: Tenofovir disoproxil fumarate was mutagenic in the in vitro mouse lymphoma assay and negative in an in vitro bacterial mutagenicity test (Ames test). In an in vivo mouse micronucleus assay, tenofovir disoproxil fumarate was negative when administered to Impairment of Fertility: Dolutegravir and Lamivudine: Dolutegravir or lamivudine did not affect male or female fertility in rats at doses associated with exposures approximately 44 or 112 times (respectively) higher than the exposures in humans at the doses of 50 mg and 300 mg (respectively). Tendrovir Disagroxil Fumarate: There were no effects on fertility, mating performance or early embryonic development when tendrovir disagroxil fumarate was administered to male ratis at a dose equivalent to 10 times the human dose based on body surface area comparisons for 20 days prinor to mating and to female ratis for 15 days prior to mating and to female ratis for 15 days prior to mating through day seven of gestation. There was, however, an alteration of the estrous cycle in Tenofovir Disoproxil Fumarate: Tenofovir and tenofovir disoproxil fumarate administered in toxicology studies to rats, dogs, and monkeys a

Includes subjects who discontinued due to an adverse event or death at any time point if this resulted in no virologic data on treatment during the analysis window. Other includes reasons such as withdrew consent, loss to follow-up, moved, and protocol d The primary endpoint was assessed at Week 48 and the virologic success rate was 88% in the group receiving dolutegravir and 81% in th fixed-dose efavirenz/emtricitabine/tenofovir disoproxil fumarate group, with a treatment difference of 7.4% and 95% CI of (2.5%, 12.3%). nent differences were maintained across baseline characteristics including baseline viral load, CD4+ cell count, age, gender, and race. The ed mean changes in CD4+ cell counts from baseline were 378 cells per mm' in the group receiving dolutegravir + fixed-dose abacavir sulfate

Adjusted for pre-specified stratification factors

ind lamivudine and 332 cells per mm³ for the fixed-dose efavirenz/emtricitabine/tenofovir disoproxil fumarate group at 144 weeks. The adjusted lifference between treatment arms and 95% Cl was 46.9 cells per mm² (16.6 cells per mm², 78.2 cells per mm²) (adjusted for pre-specified tratification factors: baseline HIV-1 RNA, and baseline CD4+ cell count).

In SALLING, there were 715 subjects included in the efficacy and safety analyses (see full prescribing information for dolutegravir). At Week 48, 71% of subjects randomized to dolutegravir plus background regimen versus 64% of subjects randomized to raltegravir plus background regimen had HIV-1 RNA less than 50 copies per mL (treatment difference and 95% C1: 7.4% [0.7%, 14.2%]). Dolutegravir: IMPAACT P1093 is a Phase 1/2, 48-week, multicenter, open-label trial to evaluate the pharmacokinetic parameters, safety, tolerability, and efficacy of dolutegravir in combination treatment regimens in HIV-1-infected infants, children, and adolescents. Subjects were stratified by age, enrolling adolescents first (Cohort 1: aged 12 to less than 18 years) and then younger children (Cohort 2A: aged 6 to less than 12 years). All subjects received a weight-based dose of dolutegravir. These 46 subjects had a mean age of 12 years (range: 6 to 17), were 54% female and 52% black. At baseline, mean plasma HIV-1 RNA was 4.6 log, copies per mL, median CD4 - e Blocunt was 638 cells per mm<sup>2</sup> (range: 9 to 1,700), and median CD4 + % was 23% (range: 1% to 44%). Overall, 39% had baseline plasma HIV-1 RNA greater than 50,000 copies per mL and 33% had a CDC HIV clinical classification of category C. Most subjects had previously used at least 1 NNRT1 (50%) or 1 PI (70%). previously used at least 1 NNRTI (50%) or 1 PI (70%).

At Week 24, the proportion of subjects with HIV-1 RNA less than 50 copies per mL in Cohort 1 and Cohort 2 Awas 70% (16(23) and 61%). (14/23), respectively, At Week 48, the proportion of subjects from Cohort 1 with HIV-1 RNA less than 50 copies per mL was 61% (14/23). (Virologic outcomes were also evaluated based on body weight. Across both cohorts, virologic suppression (HIV-1 RNA less than 50 copies per mL) at Week 24 was achieved in 75% (18/24) of subjects weighting at least 40 kg and 65% (61/11) of subjects in the 30 to less than 40 kg weight-band. At Week 48, 63% (12/19) of the subjects in Cohort 1 weighing at least 40 kg were virologically suppressed.

The median CD4+ cell count increase from baseline to Week 48 was 84 cells per mm² in Cohort 1. For Cohort 2A, the median CD4+ cell count increase from baseline to Week 24 was 209 cells per mm². increase from baseline to Week 24 was 209 cells per mm<sup>-</sup>.

Lamivudine: Clinical Endpoint Trial: ACTG300 was a multicenter, randomized, double-blind trial that provided for comparison of lamivudine plus zidovudine with didanosine monotherapy. A total of 471 symptomatic, HIV-1-infected therapy-naive (less than or equal to 56 days of antiretroviral therapy) pediatric subjects were enrolled in these 2 treatment arms. The median age was 2.7 years (range; 6 weeks to 14 years), 58% were female, and 88% werenon-white. The mean baseline CD4 + cell count was 886 cell sper mm<sup>-</sup> (mean: 1,080 cells per mm<sup>-</sup> and range) to 1,555 cells per mm<sup>-</sup> for subjects aged less than or equal to 5 years; mean: 419 cells per mm<sup>-</sup> and range; 10 to 1,555 cells per mm<sup>-</sup> for subjects aged less than or equal to 5 years; and the magnature of the subjects aged to 200 cells per mm<sup>-</sup> and magnature on trial was 10.1 months for the subjects aged over 5 years) and the

Missing data during window but on study	1%	1%

Predicted difference (95% CI) of response rate is -4.5% (-11% to 2%) at Week 96. Includes subjects who discontinued due to lack or loss of efficacy or for reasons other than an adverse event or death, and had a viral load value of greater than or equal to 80 copies per mL, or subjects who had a switch in background regimen that was not permitted by the protocol.

Other includes reasons such as withdrew consent, loss to follow-up, etc. and the last available HIV-1 RNA less than 80 copies per mL (or missing).

Analyses by formulation demonstrated the proportion of subjects with HIV-1 RNA of less than 80 copies per mL at randomization and Week 96 was higher in subjects with had received fablet formulations (75% [458]610] and 72% [408]001]) than in those who had received any solution formulations at any time (52% [209]65] and 54% (3056)], respectively. These differences were observed in each different age group evaluated. 16 HOW SUPPLIED/STORAGE AND HANDLING Dolutegravir, Lamivudine and Tenofovir disoproxil fumarate tablets, 50 mg/300 mg /300 mg are orange colored, modified capsule shaped, biconvex ilm coated tablets debossed with 'H' on one side and 'D' and '17' on the other side.They are supplied in HDPE bottles of 30, 60, 90, 100 or 750 Bottle of 30 tablets NDC 68554-3160-1

Store below 30°C (86°F). ture, dispense the packages of 30, 60 and 90 tablets in their original bottles. Do not remo PATIENT COUNSELING INFORMATION Advise the patient to read the FDA-approved patient labeling (Patient Information

Drug Interactions: Do not coadminister dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets with dof between dofetilide and dolutegravir can result in potentially life-threatening adverse events [see Contraindications / to report to their healthcare provided the use of any other prescription or nonprescription medication or herbal products. Lactic Acidosis/Hepatomegaly: Inform patients that some HIV medicines, including dolutegravir, lamivudine, and tenofovir disoproxil fumarate tablets, can cause a rare, but serious condition called lactic acidosis with liver enlargement (hepatomegaly) *[see Boxed Warning, Warnings and Precautions [6.1]].* Patients with Hepatitis B or C Co-infection: Patients with underlying hepatitis B or C may be at increased risk for worsening or development or transaminase elevations with use of dolutegravir, lamivudine, and tenofovir disoproxil furnarate tablets and advise patients to have laborator testing before and during therapy see Warnings and Precautions (5.2)!. Advise patients co-infected with HIV-1 and HBV that worsening of liver disease has occurred in some cases when treatment with lamivudine or disoproxil furnarate were discontinued. Advise patients to discuss any changes in regimen with their physician/see Warnings and Precautions (5.2)/. Inform patients with HIV-1/HCV co-infection that hepatic decompensation (some fatal) has occurred in HIV-1/HCV co-infection and interferon alfa with or without ribavirin/see Warnings and Precautions (5.6)/. Effects on Serum Liver Biochemistries in Patients with Hepatitis B or C Co-infection: Advise patients that it is recommended to have laboratory testing before and during therapy as patients with underlying hepatitis B or C may be at increased risk for worsening or development of transaminase elevations with use of dolutegravir [see Warnings and Precautions (5.2)]. Inform patients co-infected with HIV-1 and HBV that deterioration of liver disease has occurred in some cases when treatment with lamivudine was discontinued. Advise patients to discuss any changes in regimen with their healthcare provider, see Warnings and Precautions (5.2)!.

Inform patients with HIV-1 HICV co-infection that hepatic decompensation (some fatal) has occurred in HIV-1 HICV co-infected patients receiving combination antiretroviral therapy for HIV-1 and interferon affa with or without ribavirin (see Warnings and Precautions (5.6)). evere acute exacerbations of hepatitis have been reported in patients who are infected with HBV or coinfected with HBV and HIV-iscontinued tenofovir disoproxil fumarate [see Warnings and Precautions (5.2)]. Patients with HIV-1 should be tested for Hepatitis B virus (HBV) before initiating antiretroviral therapy [see Warnings and Precautions (5.2)]. In patients with chronic hepatitis B, it is important to obtain HIV antibody testing prior to initiating tenofovir disoproxil fumarate/see Warnings and Precautions (5.2).

Risk of Pancreatitis: Advise parents or guardians to monitor pediatric patients for signs and symptoms of pancreatitis (see Warnings and Precautions (5.41). Renal Impairment: Renal impairment, including cases of acute renal failure and Fanconi syndrome, has been reported in association with the use of tenofowir disoproxil fumarate. Dolutegravir, laminudine, and tenofowir disoproxil fumarate tablets should be avoided with concurrent or recent use an emphrotoxic agent (e.g., high dose or multiple NSJAIDs) [see Warmings and Precautions (5.5)]. Dossing interval of tenofowir disoproxil fumarate ma a metabolic specific page, improved in implementation in the properties of the prope Coadministration with Other Products: Do not use with other products containing lamivudine, entricitabine, tenofovir disoproxil fumarate, or tenofovir alafenamide Jase Warnings and Precautions (5.7)/I. Dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets should not be administered in combination with adefovir diproxal (HEPSERA) Jose Warnings and Precautions (5.5)/J.

Bone Effects: Decreases in bone mineral density have been observed with the use of tenofovir disoproxil fumarate. Bone mineral density monitoring should be considered in patients who have a history of pathologic bone fracture or at risk for osteopenia [see Warnings and Precautions (5.8)/J. Fat Redistribution: Inform patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy and that the cause and long-term health effects of these conditions are not known at this time/see Warnings and Precautions (5.9)/. Immune Reconstitution Syndrome: In some patients with advanced HIV infection, signs and symptoms of inflammation from previous infections may occur soon after anti-HIV treatment is started. It is believed that these symptoms are due to an improvement in the body's immune response, enabling the body to fight infections that may have been present with no obvious symptoms. Advise patients to inform their healthcare provider immediately of any symptoms of infection/see Warnings and Precautions (5.10)/. Information about HIV-1 Infection; Dolutegravi, Insimudia and recounts (s. t. t).

Information about HIV-1 Infection; Dolutegravi, Insimudia and tendroir disapproxil fumarate tablets are not a cure for HIV-1 infection and patients may continue to experience illnesses associated with HIV-1 infection; including opportunistic infections. Patients should remain under the care of a physician when using dolutegravi, lamivudine and tenofroir disapproxil fumarate tablets. Inform patients that sustained decreases in plasma HIV RNA have been associated with a reduced risk of progression to AIDS and death. Advise patients to remain under the care of a physician when using dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets. Advise patients to avoid doing things that can spread HIV-1 infection to others

Advise patients not to re-use or share needles or other injection equipment.

Advise patients not to share personal items that can have blood or body fluids on them, like toothbrushes and razor blades. Advise patients to always practice safer sex by using a latex or polyurethane condom to lower the chance of sexual contact with semen, vaginal Female patients should be advised not to breastfeed because it is not known if dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets can be passed to your baby in your breast milk and whether it could harm your baby. Mothers with HIV-1 should not breastfeed because HIV-1 can be passed to the baby in the breast milk. Instruct patients to read the Patient Information before starting dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets and to reread it Instruct patients to inform their physician or pharmacist if they develop any unusual symptom, or if any known symptom persists or worsens

Instruct patients that if they miss a dose, they should take it as soon as they remember. If they do not remember until it is within 4 hours of the time for the next dose, they should be instructed to skip the missed dose and go back to the regular schedule. Patients should not double their next dose or take more than the prescribed dose. nstruct patients to store dolutegravir, lamivudine and tenofovir disoproxil fumarate tablets in the original package, protect from moisture, and keep he bottle tightly closed. Do not remove desiccant. Other brands listed are the registered trademarks of their respective owners and are not trademarks of Hetero Labs Limited.
